Mocha pattern only applies to the 'tree' like pattern made of tobacco juice and pee. 'Dipt' is best term for all slip dec wares, which body of this would have been)	1775	1850
436	7	Eileen Kao		1	Household	Ceramic	Refined Earthenware	Flatware	Rim Sherd		Whiteware		Painted	Shell Edge, Indeterminate	(Instead of general tablewares this is definitely flatware. Most shell edge is. Since it's scalloped I changed end date to 1840)	1815	1840
436	8	Eileen Kao		1	Household	Ceramic	Porcelain	Cup	Rim Sherd		Porcelain, Hard Paste		Gilding	Banded	(Took dates out. This could be liquid gold gilding which would make it 1870 early date but I'm not sure about that soooo, no dates. Other than that, perfect!)		
466	1	Eileen Kao		2	Household	Ceramic	Refined Earthenware	Hollowware	Body Sherd		Whiteware		Printed	Floral	(Handle is sprig molded, whole vessel not molded. Printing is primary decoration and sprig molded handle secondary. WW, not PW and light blue printing makes a difference for dates)	1825	1915

466	2	Eileen Kao		1	Household	Ceramic	Refined Earthenware	Hollowware	Body Sherd		Whiteware		Printed	Indeterminate	(PW, not WW, light blue so that makes a difference w/ dates and since it's printed on both sides safe to say it's hollowware.)	1825	1915
466	3	Eileen Kao		1	Household	Ceramic	Refined Earthenware	Flatware	Rim Sherd		Pearlware		Painted	Shell Edge, Indeterminate	very small portion of rim remains, most likely edgeware (Yep, definitely shell edge so you can give it broad dates, not a dish but general flatware)	1775	1835
466	4	Eileen Kao		1	Household	Ceramic	Refined Earthenware	Tableware, General	Base Sherd		Creamware		Indeterminate		(Only thing I would say about this is note the freestanding round base and extensive use wear on interior and base + you don't know if this is undecorated, not enough of vessel so changed dec to 'Indeterminate')	1762	1820
466	5	Eileen Kao		1	Household	Ceramic	Refined Earthenware	Flatware	Rim Sherd		White Granite		Indeterminate		(Flatware, for sure and I'm going to give you some crappy white granite so you can tell it apart from whiteware. It's basically thicker and higher fired)	1842	1930

466	6	Eileen Kao		3	Household	Ceramic	Coarse Earthenware	Dish	Body Sherd		Redware		Slip Decorated	Trailed Slip	similar paste and other characteristics although possibly from different vessels. (The early date you gave is only for buff body slip wares. Hard to date slip decorated redwares. Safe to give end date of 1870 but no early date unless u have more)		1870
466	7	Eileen Kao		1	Household	Ceramic	Stoneware	Jar	Rim Sherd	Gray	Salt Glazed, Gray/ Buff Bodied		Cordoned & Painted	Banded	blue painted and incised, "2" impressed on rim (Westerwald and Rhenish refer to German finely potted stoneware. Also, nothing from Germany is going to have 'Albany' slip, which this does. The '2' denotes volume, so it's 2 gallons. Note Dec type)	1805	1910

466	13	Eileen Kao		1	Commercial	Metal	Copper Alloy	Coin	Whole			Stamped	Indeterminate		Draped Bust One Cent coin. Most likely 1798 since last number appears to be an '8'. Gave broad dates.	1796	1807
467	1	Eileen Kao		1	Household	Ceramic	Porcelain	Hollowware	Rim Sherd		Porcelain, Soft Paste		Indeterminate		small cup-like hollowware form (not enough of vessel to determine decoration, changed to 'Indeterminate' - No way to tell if English soft paste, reserve for porcelain with marks)		
467	2	Eileen Kao		1	Household	Ceramic	Porcelain	Indeterminate	Base Sherd		Porcelain, Hard Paste		Indeterminate		low profile base sherd, saucer/ plate/ bowl (Changed dec from undec to 'Indeterminate' b/ c not enough to determine. Also, original ware listed as bone china, this has a 'creamy' look so changed to 'hard paste'. Added wedge footing to base)		
467	3	Eileen Kao		1	Household	Ceramic	Porcelain	Plate	Base Sherd		Porcelain, Chinese Export		Painted	Indeterminate			1840
467	4	Eileen Kao		1	Household	Ceramic	Porcelain	Indeterminate	Base Sherd		Porcelain, Chinese Export		Painted	Indeterminate	(Added undercut footing to base type)		1840

467	7	Eileen Kao		1	Household	Ceramic	Refined Earthenware	Hollowware	Body Sherd		Pearlware		China Glaze, Painted	Indeterminate	(Changed primary dec to 'China Glaze'. The more of this you see, the more you'll recognize! Narrows down dates.)	1775	1810
467	8	Eileen Kao		1	Household	Ceramic	Refined Earthenware	Indeterminate	Body Sherd		Pearlware/Whiteware		Printed	Indeterminate	(I'd say the sherd is too small to determine ware exactly, although likely whiteware - gave broad dates based on printing decoration. Specify in secondary decoration if spalled.)	1807	1915
467	9	Eileen Kao		1	Household	Ceramic	Refined Earthenware	Hollowware	Body Sherd		Pearlware		Printed	Romantic Scenery	(This is 'old blue' or 'reverse/ negative' printing. Typified by a very dark blue printing which fills in background and leaves pattern in white. Also, curve indicates London shape. Bowl or cup)	1815	1840
467	10	Eileen Kao		2	Household	Ceramic	Refined Earthenware	Indeterminate	Body Sherd		Whiteware		Printed	Indeterminate	(WW, not PW and cannot determine vessel form. Given light blue color, dates more narrow)	1825	1915
467	11	Eileen Kao		1	Household	Ceramic	Stoneware	Hollowware	Base Sherd	Gray	Salt Glazed, Gray/ Buff Bodied		Albany-Type Slip		dark brown interior slip (This is the primary decoration as far as you know so changed dec from 'Indeterminate' to 'Albany-type slip')

COMMENTS #1

These remains consist of a complete left 3rd proximal hand phalange. This material was found mixed in with animal bones from the same context which suggest that this bone was redeposited from elsewhere. MxL Measurements taken. No evidence for pathology. Minimum age 16.5 is based on fusion rates but it more likely that this individual was older.

COMMENTS #1

These remains consist of a single molar (upper right 2nd molar). This tooth was mixed in with animal bones from the same context which suggest that this bone was redeposited from elsewhere. No grave or burial. No sex determination. Tooth is completely formed with some evidence of dental wear. Based on these characteristics it is likely that this tooth is from an individual greater than 16 years of age. There is some evidence for calculus present on the mesial and distal surfaces of the tooth. In addition, there are 2 caries present on the lateral surface of the tooth one moderate and one small.

COMMENT#2

Tooth is complete and in good condition. The presence of dental wear (non-pathological) and the completion of the roots makes it clear that his tooth was completely erupted and in occlusion. There is some evidence for calculus present in addition to 2 caries located on the lateral surface of the tooth. One carie (smaller of the two) is found just below the CEJ. The large carie is located just above the CEJ and measures approximately 3mmX1.8mm.

COMMENTS #1

These remains consist of a complete, but broken, right tibia from the wall cleaning of Tweed Manhole #1. The prx end was broken, but PM still present. There is no evidence for pathology. MxL was taken by holding the prx end in place. Stature estimation is given for black and white males and females as sex and ancestry assessment was not possible for this bone. Based on MxL this individual was, depending on sex and ancestry, between 157.91cm and 166.146cm or 62.16 and 65.41 inches tall. See table in report for details on stature reconstruction.

COMMENTS #1

These remains consist of a partial shaft of a single femur. The prox and distal ends are missing PM. There is no evidence for pathology. Based on laboratory specimen comparison and the overall size of the bone it is likely that this bone was from an individual greater than 17 years of age. Determination of sex was not possible. Measurements were taken but stature reconstruction was not attempted due to the PMD.

COMMENTS #1

These remains consist of a group of bones excavated from CHP on 6/7/2011 from FS#480 Tweed Manhole Extension (General Collection). These bones consists of a mixture of adult and child bones with an MNI of 2. These remains were originally mixed with non-human animal bones. All material from this collecting, with the exception of the first rib, was fragmented and ranged in completeness from less than 10% complete to complete. In addition to the identifiable elements, two cranial fragments (human) could not be identified specific bone. Determination off sex, and stature, was not possible using standard macroscopic methods. General age categories were used as more sensitive regions used for ageing (pelvis, sutures, etc.) were not present.

As it was clear based on the presence of adult and non-adult bone that there was an MNI of 2, two SubSP numbers were assigned for data entry. The adult material was given SubSP# CHP2011FS480-A1 and the child material received CHP2011FS480-A2 with the understanding that these remains could represent more than two individuals.

CHP2011FS480-A1: This material now consists of fragmented human bones from an individual/individuals likely older than 17 years of age (young adult). Bones were originally mixed in with animal bones from the trench. Bones from this material do not consist of elements that are conducive of sex determination, age determination, ancestry, or stature. No pathology was identified. Post-mortem damage was observed on all bones except for the first rib.

CHP2011FS480-A2: This material consists of fragmentary child bones all of which, except for the parietal fragments are from an individual(s) between 4-5 years of age. No pathology. Ages for these remains was based on comparative laboratory specimens and were based on size similarities. No other information extractable.

Bone is in fair condition missing most of the inferior surface of the bone (PM) and posterior end of the bone (also PM). There is no evidence for pathology. Bone articulates with the talus from this sample.

Bone is in poor condition, missing the majority of the dorsal surface and all of the distal epiph and part of the medial and lateral shaft (all PM). There is no evidence for pathology. Based on the overall morphology and size, it is likely that this bone is NOT PHP number 1, 4 or 5. The side and the specific PHP number could not be identified.

These remains consist of a group of bones excavated from CHP on 6/7/2011 from FS#480 Tweed Manhole Extension (General Collection). These bones consists of a mixture of adult and child bones with an MNI of 2. These remains were originally mixed with non-human animal bones. All material from this collecting, with the exception of the first rib, was fragmented and ranged in completeness from less than 10% complete to complete. In additional to the identifiable elements, two cranial fragments (human) could not be identified specific bone. Determination off sex, and stature, was not possible using standard macroscopic methods. General age categories were used as more sensitive regions used for ageing (pelvis, sutures, etc.) were not present.

As it was clear based on the presence of adult and non-adult bone that there was an MNI of 2, two SubSP numbers were assigned for data entry. The adult material was given SubSP# CHP2011FS480-A1 and the child material received CHP2011FS480-A2 with the understanding that these remains could represent more than two individuals.

CHP2011FS480-A1: This material now consists of fragmented human bones from an individual/individuals likely older than 17 years of age (young adult). Bones were originally mixed in with animal bones from the trench. Bones from this material do not consist of elements that are conducive of sex determination, age determination, ancestry, or stature. No pathology was identified. Post-mortem damage was observed on all bones except for the first rib.

CHP2011FS480-A2: This material consists of fragmentary child bones all of which, except for the parietal fragments are from an individual(s) between 4-5 years of age. No pathology. Ages for these remains was based on comparative laboratory specimens and were based on size similarities. No other information extractable.

Bone in good condition- missing approximately 25% of the blade and fragments from the spine and all of the acromion process. The glenoid fossa epiphysis, coroid process and the acromion process are unfused and missing post-mortem. No pathology affecting the supra or infra spinous fossae. Based on comparison to laboratory samples this scapula is likely from a child between 4 and 5 years of age.

Bone in in poor condition - missing approximately 90%. All that remains is part of the scapula blade. Based on size comparisons to laboratory samples this scapula is likely from a child approximately 5 years of age. The age determination should be viewed with caution due to small size of the fragment.

Bone in poor condition. All that remains is a small but identifiable fragment of the posterior ilium which includes a small section of the auricular surface and a small section of the posterior unfused surface of the iliac spine. Comparison to laboratory samples suggest that this bone is likely from an individual approximately 5 years of age.

Two small fragments of parietal. Identification is based on the presence of the meningeal grooves on the endocranial surface. Based on crania of similar thickness it is possible that these remains were from a child. Two unidentified cranial fragments also present both 2cm x 2cm.
