MANAGEMENT SUMMARY

SHPO Project Review Number (if available): **14PR01812**

Involved State and Federal Agencies: **NYSDEC, NYSDOS, NYSDOT, USACE**

Phase of Survey: **Phase IA Archaeological Documentary Study**

Location Information
- Location: **Multiple roadways and portions of Brookville Park and Hook Creek Park**
- Minor Civil Division: **08101**
- County: **Queens**

Survey Area
- Length: **Total length of project site roadways is 17,922 feet**
- Width: **Roadways range from 28-38 feet in width**
- Number of Acres Surveyed: **Total BMP and WEA areas are ca. 5.5 acres and 2.5 acres, respectively**

USGS 7.5 Minute Quadrangle Map: **Jamaica and Lynbrook**

Archaeological Survey Overview
- Number & Interval of Shovel Tests: **N/A**
- Number & Size of Units: **N/A**
- Width of Plowed Strips: **N/A**
- Surface Survey Transect Interval: **N/A**

Results of Archaeological Survey
- Number & name of precontact sites identified: **None**
- Number & name of historic sites identified: **None**
- Number & name of sites recommended for Phase II/Avoidance: **None**

Report Authors(s): **Julie Abell Horn, M.A., R.P.A., Historical Perspectives, Inc.**

Date of Report: **February 2023**

EXECUTIVE SUMMARY

The New York City Department of Design and Construction (DDC), on behalf of the New York City Departments of Environmental Protection (DEP) and Transportation (DOT), is proposing Capital Project HWQ7241B1/SEQ200529.[1] The proposed project includes street reconstruction with drainage and other infrastructure improvements for portions of the Brookville and Rosedale neighborhoods of Queens, New York. The proposed project area is generally bounded by 228th Street to the west, Huxley and 241st Streets to the east, Idlewild Park to the south, and 145th Avenue to the north and includes improvements to the intersection of Brookville and Rockaway Boulevards (Figures 1 and 2a-2b and Appendices A and B).

The proposed project includes the full reconstruction of approximately 17,922 linear feet of city streets, which includes replacing all curbs, sidewalks, and paved surfaces throughout the proposed project area. Also proposed within the project is replacing approximately 18,100 linear feet of water mains and 5,400 linear feet of sanitary sewers.

The proposed drainage improvements include installing new stormwater collection sewers (about 12,200 linear feet) that would drain to six outfalls. Two of these outfalls would discharge directly to Conselyea's Creek[2] (which is a tributary to Jamaica Bay) at the existing culvert where 147th Avenue passes over the creek. The other four outfalls would discharge to two proposed Best Management Practices (BMPs). Also proposed is a graded and vegetated swale to handle drainage that collects at the end of 148th Avenue. Together, these drainage management systems are referred to as BMPs #1, #2, and #3, which have been proposed for the purposes of providing stormwater detention and/or flow rate attenuation for the project area runoff that drains to them prior to release of the runoff to Conselyea's Creek. Each of the proposed BMPs is located in Brookville Park, which is land under the jurisdiction of the City's Department of Parks and Recreation (NYC Parks).

To carry out the proposed improvements, the City must acquire 626,731 square feet (sf) of private lot area in several of the project area streets. In addition to being located partially in Brookville Park, BMP #2 is also located in the unbuilt ROW of 235th Street between 148th Drive on the south and Bentley Road on the north. The in-street portion of the BMP therefore requires a demapping of the affected street segment. The proposed BMP #2 design includes three vacant City-owned tax lots and two vacant privately owned lots, the latter of which will require acquisition by the City. Both the street demapping and acquisition of the two tax lots are actions subject to Uniform Land Use Review Procedure (ULURP) approval.

Based on the permanent impacts and the NYSDEC wetland restoration requirements, the proposed project is required to restore 2.89 acres of tidal wetlands. It is proposed that restoration for these permanent impacts be provided both at the BMP sites and at a wetland restoration site in Hook Creek Park. The temporary impacts at BMP #3 would be addressed as part of the BMP design. These three tidal restoration locations are referred to in this report as "Wetland Expansion Areas" or WEAs. WEA #1 is proposed to be located between BMP #1 and Conselyea's Creek in Brookville Park, WEA #2 is proposed to be located north of BMP #3 and southeast of 232nd Street in Brookville Park, and WEA #3 is proposed to be located immediately south of 149th Avenue and 241st Street in Hook Creek Park.

Finally, the proposed project includes improvements at the intersection of Brookville Boulevard and Rockaway Boulevard with the addition of right-turn lanes, new paved surfaces, and striping that would enhance traffic circulation and vehicle and pedestrian safety at this intersection.

The proposed project requires permits and approvals from various local, state, and federal agencies, including DOT; DEP; NYC Parks; the New York City Planning Commission (CPC); the Department of City Planning (DCP); DEC (including a State Pollutant Discharge Elimination System [SPDES] General Permit); the New York State Department of State (NYSDOS); the New York State Department of Transportation (NYSDOT); and the U.S. Army Corps of Engineers (USACE). As such, the proposed project is subject to New York City Environmental Quality

[1] Project specific information in this and subsequent sections is excerpted and adapted from the project's 2023 Draft Environmental Assessment Statement (EAS), prepared by AKRF, Inc. and Hazen & Sawyer, P.C.

[2] Conselyea's Creek historically had several different names, including Simonson's/Simmons' Creek and Old Mill Creek.

Review (CEQR); New York State Environmental Quality Review Act (SEQRA); Section 14.09 of the New York State Historic Preservation Act; and Section 106 of the National Historic Preservation Act. Pursuant to the requirements of CEQR and SEQRA, DEP will be the Lead Agency in the environmental review process and in that role, will perform a coordinated review with the involved agencies that would also be issuing discretionary approvals for the project (e.g., DOT, NYC Parks, DCP, DEC, etc.). The lead agency under Section 106 of the National Historic Preservation Act will be the USACE.

The proposed project requires discretionary actions; as such an Environmental Assessment Statement (EAS) is being prepared to meet the requirements of the City Environmental Quality Review Act (CEQR) and the State Environmental Quality Review Act (SEQRA).

As part of the CEQR review, project initiation materials were submitted to the New York City Landmarks Preservation Commission (LPC) in August 2022. The LPC responded that "the project site does not appear to possess archaeological significance" (Santucci 8/9/2022).

As part of the SEQRA and Section 106 of the National Historic Preservation Act review, project initiation materials were submitted to the New York State Historic Preservation Office (SHPO) in August 2022. The SHPO responded:

> The project is in an archaeologically sensitive area. Therefore, the State Historic Preservation Office/Office of Parks, Recreation and Historic Preservation (SHPO/OPRHP) recommends that a Phase IA Literature Search and Sensitivity Assessment survey is warranted. A Phase IA archaeological survey is designed to identify previously recorded archaeological sites and other cultural resources within or near the project area, to assess the archaeological sensitivity of the project area, to document previous ground disturbance and to make recommendations regarding the potential need for Phase IB subsurface archaeological testing (Lloyd 9/12/2022).

On behalf of the DDC and retained by AKRF, Inc., Historical Perspectives, Inc. (HPI) has undertaken this required Phase IA Archaeological Documentary Study to satisfy the requirements of SEQRA/CEQR and Section 106 of the National Historic Preservation Act, and to comply with the standards of the SHPO and the LPC (New York Archaeological Council 1994; OPRHP 2005; LPC 2018; CEQR 2021).

The Area of Potential Effect (APE) for this project includes all areas that will be subjected to ground disturbance. This includes the project's existing and proposed roadways and their associated subsurface utilities, the BMP locations, and the WEA locations.

The purpose of this Phase IA Archaeological Documentary Study was to determine whether archaeological resources from Native American and historical period occupations could have been deposited in the project site, if they could have remained intact, surviving later historical development and disturbance, and if any potential resources could be impacted by proposed project plans. The following sections outline the conclusions for these resources.

From what is known of precontact period settlement patterns on Long Island, most habitation and processing sites are found in sheltered, elevated sites close to wetland features, major waterways, and with nearby sources of fresh water. The project site once contained a combination of firm ground and natural marshlands surrounding tidal creeks. Native Americans would have been drawn to these creeks and marshlands for their aquatic life, wild game, and vegetation. As well, wetlands provided peat that could be used for fuel and a number of plants that served as materials for clothing, basketry and weaving. As importantly, the use of certain aquatic plants for medicinal purposes is ethnographically documented (Herrick 1995).

Precontact period sites, primarily from the Woodland Period, have been documented along the Jamaica Bay shoreline in proximity to marshlands. In some cases, extensive shell middens extended into the marshlands, the equivalent of precontact garbage dumps. Defined as deposits of shells, gravel, sand and silt and in some cases other cultural remains, they occur either as distinct cultural events or in association with habitation sites (Wells 2001). Along some areas of Jamaica Bay, these shell middens have been found under layers of modern fill, but on top of marshland soils (Pickman 1987:4). Additionally, prior to the creation of Jamaica Bay and its marshlands after the last Ice Age, the entire project site would have been dry land. It is possible that precontact period archaeological

sites from this period, dating from the Paleo Indian period through parts of the Archaic period, could remain capped by later marshland soils that accrued after the sea level rise, ca. 2000-4000 B.P.

Despite the generalized potential precontact period archaeological sensitivity for the Jamaica Bay vicinity, a number of factors argue against this sensitivity for the project site itself. The majority of the roadways within the project site were once on firm ground, in proximity to marshlands. However, there has been significant disturbance to these roadway locations from the grading and filling activities necessary to create the roads, as well as the installation of multiple subsurface utilities beneath the roads. Over 100 soil borings from the roadways across the project site (taken outside of the utility footprints which would have been completely disturbed) indicated that there were no obvious soil strata that could have suggested precontact period occupation, such as lenses of dark soil suggesting a Buried A horizon, or concentrations of shell and organic materials that might have been markers of shell middens. The BMP and WEA locations were all once within marshlands that formed after the last Ice Age, and so would have been less likely to contain precontact resources. Today these marshlands have been covered with fill and debris, which were deposited using heavy machinery, causing disturbance to the natural landform. Soil borings within the BMPs did not record any concentrations of shell and organic material, which might have indicated shell middens, nor did they record any layers of peat, which may have capped an earlier landform from a time when these areas were dry land. Finally, there have not been any previous precontact period archaeological sites recorded within the project site or in close proximity. Most of the precontact sites that were previously noted in the Jamaica Bay area were recorded over a century ago, in a period prior to the widespread development that has characterized the area since that time.

For these reasons, HPI concludes that the project site has a low precontact period archaeological sensitivity.

The project site and vicinity were minimally developed prior to the second half of the twentieth century. Among the earliest uses of the project site vicinity was for a saw mill and grist mill, located at the southern end of the artificially dammed Conselyea's Pond, but well outside the project site boundaries. Prior to the creation of the current city street grid, the project site was mostly used for farmland and woodland. There were only a scattering of buildings along the two main roads of Brookville Boulevard and 147th Avenue. Historic maps suggest that none of these buildings were within the footprints of the current project site streets, nor were their immediate yards where any archaeological deposits would be anticipated. The buildings generally were set back from the main roadways, often on multiple-acre tracts. Furthermore, the BMP and WEA locations were once within marshlands and were not developed or otherwise occupied.

Given these factors, HPI concludes that the project site has a low historic period archaeological sensitivity.

Based on the conclusions outlined above, HPI recommends that no additional archaeological investigations are warranted for the project site.

BMPs and WEAs:

I. INTRODUCTION

The New York City Department of Design and Construction (DDC), on behalf of the New York City Departments of Environmental Protection (DEP) and Transportation (DOT), is proposing Capital Project HWQ7241B1/SEQ200529.[3] The proposed project includes street reconstruction with drainage and other infrastructure improvements for portions of the Brookville and Rosedale neighborhoods of Queens, New York. The proposed project area is generally bounded by 228th Street to the west, Huxley and 241st Streets to the east, Idlewild Park to the south, and 145th Avenue to the north and includes improvements to the intersection of Brookville and Rockaway Boulevards (Figures 1 and 2a-2b and Appendices A and B).

The proposed project includes the full reconstruction of approximately 17,922 linear feet of city streets, which includes replacing all curbs, sidewalks, and paved surfaces throughout the proposed project area. Also proposed within the project is replacing approximately 18,100 linear feet of water mains and 5,400 linear feet of sanitary sewers.

The proposed drainage improvements include installing new stormwater collection sewers (about 12,200 linear feet) that would drain to six outfalls. Two of these outfalls would discharge directly to Conselyea's Creek[4] (which is a tributary to Jamaica Bay) at the existing culvert where 147th Avenue passes over the creek. The other four outfalls would discharge to two proposed Best Management Practices (BMPs). Also proposed is a graded and vegetated swale to handle drainage that collects at the end of 148th Avenue. Together, these drainage management systems are referred to as BMPs #1, #2, and #3, which have been proposed for the purposes of providing stormwater detention and/or flow rate attenuation for the project area runoff that drains to them prior to release of the runoff to Conselyea's Creek. Each of the proposed BMPs is located in Brookville Park, which is land under the jurisdiction of the City's Department of Parks and Recreation (NYC Parks).

To carry out the proposed improvements, the City must acquire 626,731 square feet (sf) of private lot area in several of the project area streets. In addition to being located partially in Brookville Park, BMP #2 is also located in the unbuilt ROW of 235th Street between 148th Drive on the south and Bentley Road on the north. The in-street portion of the BMP therefore requires a demapping of the affected street segment. The proposed BMP #2 design includes three vacant City-owned tax lots and two vacant privately owned lots, the latter of which will require acquisition by the City. Both the street demapping and acquisition of the two tax lots are actions subject to Uniform Land Use Review Procedure (ULURP) approval.

Based on the permanent impacts and the NYSDEC wetland restoration requirements, the proposed project is required to restore 2.89 acres of tidal wetlands. It is proposed that restoration for these permanent impacts be provided both at the BMP sites and at a wetland restoration site in Hook Creek Park. The temporary impacts at BMP #3 would be addressed as part of the BMP design. These three tidal restoration locations are referred to in this report as "Wetland Expansion Areas" or WEAs. WEA #1 is proposed to be located between BMP #1 and Conselyea's Creek in Brookville Park, WEA #2 is proposed to be located north of BMP #3 and southeast of 232nd Street in Brookville Park, and WEA #3 is proposed to be located immediately south of 149th Avenue and 241st Street in Hook Creek Park.

Finally, the proposed project includes improvements at the intersection of Brookville Boulevard and Rockaway Boulevard with the addition of right-turn lanes, new paved surfaces, and striping that would enhance traffic circulation and vehicle and pedestrian safety at this intersection.

---

[3] Project specific information in this and subsequent sections is excerpted and adapted from the project's 2023 Draft Environmental Assessment Statement (EAS), prepared by AKRF, Inc. and Hazen & Sawyer, P.C.

[4] Conselyea's Creek historically had several different names, including Simonson's/Simmons' Creek and Old Mill Creek.

A. Regulatory review

The proposed project requires permits and approvals from various local, state, and federal agencies, including DOT; DEP; NYC Parks; the New York City Planning Commission (CPC); the Department of City Planning (DCP); DEC (including a State Pollutant Discharge Elimination System [SPDES] General Permit); the New York State Department of State (NYSDOS); the New York State Department of Transportation (NYSDOT); and the U.S. Army Corps of Engineers (USACE). As such, the proposed project is subject to New York City Environmental Quality Review (CEQR); New York State Environmental Quality Review Act (SEQRA); Section 14.09 of the New York State Historic Preservation Act; and Section 106 of the National Historic Preservation Act. Pursuant to the requirements of CEQR and SEQRA, DEP will be the Lead Agency in the environmental review process and in that role, will perform a coordinated review with the involved agencies that would also be issuing discretionary approvals for the project (e.g., DOT, NYC Parks, DCP, DEC, etc.). The lead agency under Section 106 of the National Historic Preservation Act will be the USACE.

The proposed project requires discretionary actions; as such an Environmental Assessment Statement (EAS) is being prepared to meet the requirements of the City Environmental Quality Review Act (CEQR) and the State Environmental Quality Review Act (SEQRA).

As part of the CEQR review, project initiation materials were submitted to the New York City Landmarks Preservation Commission (LPC) in August 2022. The LPC responded that "the project site does not appear to possess archaeological significance" (Santucci 8/9/2022).

As part of the SEQRA and Section 106 of the National Historic Preservation Act review, project initiation materials were submitted to the New York State Historic Preservation Office (SHPO) in August 2022. The SHPO responded:

> The project is in an archaeologically sensitive area. Therefore, the State Historic Preservation Office/Office of Parks, Recreation and Historic Preservation (SHPO/OPRHP) recommends that a Phase IA Literature Search and Sensitivity Assessment survey is warranted. A Phase IA archaeological survey is designed to identify previously recorded archaeological sites and other cultural resources within or near the project area, to assess the archaeological sensitivity of the project area, to document previous ground disturbance and to make recommendations regarding the potential need for Phase IB subsurface archaeological testing (Lloyd 9/12/2022).

On behalf of the DDC and retained by AKRF, Inc., Historical Perspectives, Inc. (HPI) has undertaken this required Phase IA Archaeological Documentary Study to satisfy the requirements of SEQRA/CEQR and Section 106 of the National Historic Preservation Act, and to comply with the standards of the SHPO and the LPC (New York Archaeological Council 1994; OPRHP 2005; LPC 2018; CEQR 2021).

B. Project site elements

The Area of Potential Effect (APE) for this project includes all areas that will be subjected to ground disturbance. This includes the project's existing and proposed roadways and their associated subsurface utilities, the BMP locations, and the WEA locations. Each of the specific project elements is described in further detail, below.

PROPOSED STREET RECONSTRUCTION IMPROVEMENTS

The proposed street reconstruction is comprehensive and includes:

- Modifying street widths to DOT design standards by relocating curbs and improving travel lanes (see Table 1);
- Reconstructing all curbs and completing missing or deteriorated curb segments;

- Reconstructing the street grades and profiles with new pavement to provide even and consistent paved surfaces which in addition to enhancing vehicle operation safety would support the flow of runoff from the street to the catch basins and the proposed storm sewer collection system;
- Installing new catch basins to capture the street drainage and collection sewers to convey that drainage;
- Providing proper street ends and turnarounds for vehicle circulation;
- Installing traffic calming measures along Brookville Boulevard with neck-downs at high pedestrian locations, such as bus stops;
- Reconstructing and completing missing sidewalk sections to provide consistent sidewalk widths of 10 to 15 feet with 3-to-11-foot-wide planting strips between the sidewalk and curb, where feasible; and
- Final paving, striping, and landscaping of the street corridors.

Table 1: Existing and Proposed Street Dimensions

Street	Between	And	Proposed Curb-to-Curb Width

PROPOSED INFRASTRUCTURE IMPROVEMENTS

Water Supply

The proposed capital project includes replacing old, unlined cast iron watermains to improve water supply reliability. Under the proposed project, watermains along Brookville Boulevard and 147th Avenue are proposed to be replaced with 12-inch and 20-inch pipes, respectively, while 8-inch watermains would be installed throughout the balance of the project area. In total, it is proposed to replace approximately 18,100 linear feet of watermain.

Sanitary Sewer Replacement

The proposed project includes replacing approximately 5,400 linear feet of sanitary sewer in the project area. This would provide for the needed replacement of sanitary sewers as well as the relocation of sanitary sewers, as needed to install the proposed stormwater collections sewers.

STORMWATER MANAGEMENT AND BMPS

Proposed Stormwater Collection System

The proposed project includes installing new stormwater collection sewers throughout the project area with four new outfalls and activating two other outfalls at the 147th Avenue culvert over Conselyea's Creek that were recently completed under a separate capital project. The four new outfalls would direct stormwater to the two proposed BMPs. A third proposed BMP would manage overland flow coming from 148th Avenue. A description of the each of the proposed BMPs is provided below.

Proposed Best Management Practices

The stormwater management system improvements include three BMPs at the following proposed locations (see Figures 1 and 2a, Appendix B, and Table 2):

- East side of Brookville Park, west of and parallel to 235th Street (BMP #1);
- East side of Brookville Park including the bed of 235th Street and four tax lots between Bentley Road and 148th Drive (BMP #2); and
- On the west side of Brookville Park, at the end of 148th Avenue (BMP #3).

Table 2. Proposed Best Management Practices (BMPs)

BMP/Location	Size	Function
BMP #1: Brookville Park at 235th Street between 147th Road and 148th Road	±3.88 acres	Stormwater outlets (2) and detention basin
BMP #2: Brookville Park at 235th Street between Bentley Road and 148th Drive	±1.51 acres	Stormwater outlets (2) and detention basin
BMP #3: Brookville Park at 148th Avenue	± 0.14 acres	Overland flow and drainage swale
Source: HWQ724B BMP #2 Grading Study, dated February 2022 and the HWQ724B BMP #1, BMP #2, and BMP #3 Site Plans, August 2022.		

WETLAND EXPANSION AREAS

As noted in the Introduction, the proposed project also includes three "Wetland Expansion Areas" or WEAs, which are locations where wetlands will be restored and/or expanded to mitigate or offset tidal parkland acreage necessary to be taken for the construction of the BMPs. WEA #1 (0.98 acre) is proposed to be located between BMP #1 and Conselyea's Creek in Brookville Park, WEA #2 (0.52 acre) is proposed to be located north of BMP #3 and southeast of 232nd Street in Brookville Park, and WEA #3 (1.01 acre) is proposed to be located immediately south of 149th Avenue and 241st Street in Hook Creek Park.

II. METHODOLOGY

The present study entailed a review of various resources.

- Primary and secondary sources concerning the general precontact period and history of southeast Queens and specific events associated with the project site and vicinity were reviewed using materials from the Queens Public Library, the New York Public Library, the library of HPI, and using online resources.
- Historic maps and photographs were reviewed using materials from NYC Parks, the Queens Public Library, the New York Public Library, the New York City Municipal Archives, the library of HPI, and using various online websites. These maps and photographs provided an overview of the topography and a chronology of land usage for the project site. A selection of these maps and photographs has been reproduced for this report. Of note, although the NYC Parks provided a number of maps for Brookville and Idlewild Parks, none of these maps specifically overlapped with the current project site.
- Information about previously recorded archaeological sites and surveys in the area was compiled from data available at the OPRHP, the LPC, and the library of HPI.
- Several environmental studies were reviewed for the project, including a Corridor Assessment Report (LBA 2006a), a Limited Subsurface Corridor Investigation (LBA 2006b), and a Phase I Corridor Assessment and Phase II Subsurface Corridor Investigation Report (LBA 2019).
- Soil borings completed in conjunction with the environmental 2006 and 2019 studies, as well as a geotechnical report (CDM Smith 2015) were reviewed. The geotechnical soil boring data is included as Appendix C.
- HPI completed a site visit on January 10, 2023. At that time, every project site street and intersection was photographed from all directions. Given that the project site contains approximately 45 block lengths with similar and/or redundant existing conditions, this report includes a selection of representative views of these streets (Photographs 1-36, Figures 2a-b). Additionally, all proposed BMPs and WEAs were photographed; selected photographs are included for each of these locations (Photographs 37-52, Figure 2).

III. CURRENT CONDITIONS AND ENVIRONMENTAL SETTING

A. Current Conditions

PROJECT AREA STREET CORRIDORS

The street corridors that comprise the project area are listed in Table 3 and shown on Figures 1, 2a-b, and Appendix A. Photographs 1-36 provide representative views of these street corridors

Table 3. Project Street Corridors

Street	Start	End	Length (Feet)
146th Avenue	Brookville Boulevard	Edgewood Street	310
147th Avenue	229th Street	50 feet east of Edgewood Street	2,580
147th Road	235th Street	50 feet east of 241st Street	790
147th Drive	235th Street	50 feet east of 241st Street	945
148th Avenue	235th Street	50 feet east of 241st Street	1,095
148th Road	235th Street	50 feet east of 241st Street	1,230
Bentley Road	235th Street	Brookville Boulevard	445

Of these project street corridors, two are arterial collector roads:

- Brookville Boulevard, a two-way northbound-southbound street that connects Sunrise Highway on the north with Rockaway Boulevard on the south; and
- 147th Avenue, a two-way eastbound-westbound street that parallels the Belt Parkway and Sunrise Highway—connecting with Francis Lewis Boulevard on the east and Springfield Boulevard on the west.

The other streets in the project area are local streets that generally intersect with either Brookville Boulevard or 147th Avenue, and provide access primarily to residences.

All of the street corridors in the project area are paved with asphalt and contain subsurface utilities. Depending on location, these utilities include water lines, sanitary and storm sewer lines, and gas lines. Manholes and catch basins are evident throughout the project's street corridors. Electric and telecommunications service generally is provided by overhead wires on utility poles. The condition of the street corridors varies by location, but many streets exhibit evidence of poor and patched pavement, and exhibit standing water where drainage is insufficient or compromised.

BMPS AND WEAS

BMP #1 and adjacent WEA #1 are located west of 235th Street and east of the channel of Conselyea's Creek, between the approximate lines of 147th Road and 148th Road within Brookville Park (Photographs 37-42). These areas were once natural marshlands, but were covered with fill during the second half of the twentieth century. Currently, these areas are covered with trees and invasive vegetation species, which have grown in the last few decades. There is evidence of considerable dumping and earthmoving throughout BMP #1 and WEA #1.

BMP #2 includes a combination of parkland in Brookville Park, a portion of the mapped but unbuilt section of 235th Street at the western terminus of Bentley Road, and five vacant lots (Photographs 43-47). BMP #2 extends from Bentley Road south to below 148th Drive. This BMP was once entirely marshland, but has been altered through construction, grading, and filling. There was once an aviation beacon facility atop a raised and landfilled platform that currently is used for vehicle and construction equipment storage. The roadway to this former facility is accessed from 148th Drive, where a gate has been constructed. There is also marshland with invasive species and a portion of Conselyea's Creek within this area.

BMP #3 and adjacent WEA #2 are located at the eastern end of 148th Avenue, within and adjacent to Brookville Park (Photographs 48-50). WEA #2 is proposed to be located within a mapped but unbuilt portion of 232nd Street. Both of these areas were once natural marshlands, but have been landfilled. The areas exhibit uneven topography from prior earthmoving and dumping. Currently, these areas are covered with trees and invasive vegetation species, which have grown in the last few decades.

WEA #3 is located south of 149th Avenue within Hook Creek Park. It is accessed by a short, angled extension of 241st Street, although fencing precluded direct access at the time of the field visit (Photographs 51-52). This area was formerly natural marshland, which was capped with fill and now supports invasive wetland species.

B. Topography and Hydrology

In its predevelopment condition, the project site consisted of low-lying, level land and natural marshlands. The project site is bisected roughly by Conselyea's Creek. The section northeast of 147th Avenue has been dammed to form Conselyea's Pond. Southwest of 147th Avenue, Conselyea's Creek flows northeast-southwest through Brookville Park and Idlewild Park, and then turns southeast and runs through Hook Creek Park, merging with Hook Creek at the Queens/Nassau County border. The original alignment of Hook Creek flowed northeast-southwest and drained into Jamaica Bay. Today, modifications to the surrounding landform have altered that natural alignment.

As noted above, the BMPs and WEAs originally were all within natural marshlands, according to historic maps, although the different maps were not consistent as to the extent of the marshland (Conner 1852, Figure 4; Wolverton 1891, Figure 6; U.S.G.S. 1897, Figure 7; U.S.G.S. 1947, Figure 10). However, each of the BMPs and WEAs was shown to be within marshland on at least one historic map. Today, the majority of the BMP and WEA areas have been capped with several feet of fill soils mixed with dumped debris. While the predevelopment elevations of the BMPs and WEAs would have been at or just above sea level, today they range from elevations 0-10 feet (Borough of Queens Sewer Datum[5]) (see Appendix B).

Prior to development, most of the areas now containing roadways within the project site were located above the marshlands on firm ground, but generally only several feet above sea level. The locations of several modern roadways bordering Idlewild Park and Hook Creek Park within the project site were once within marshlands and have been filled in. All of the locations now supporting roadways were less than 20 feet above sea level on historic maps (e.g. U.S.G.S. 1897, Figure 7), and most of these areas likely were less than 10 or 15 feet above sea level. The areas of the project site containing the roadways have been artificially graded and filled to create the streets and abutting city blocks and lots, and to install the subsurface utilities that serve these locations.

C. Geology

Long Island is the top of a Coastal Plain ridge formation that is covered with glacial drift, in reality an elevated sea bottom demonstrating low topographic relief and extensive marshy tracts. In the last million years, as glaciers advanced and receded three times, the surficial geology of the island, including the project site, was profoundly altered. "The glacier was an effective agent of erosion, altering the landscape wherever it passed. Tons of soil and stone were carried forward, carving and planing the land surface. At the margins of the ice sheet massive accumulations of glacial debris were deposited, forming a series of low hills or terminal moraines" (Eisenberg 1978). Circa 18,000 years ago, the last ice sheet reached its southern limit, creating the Harbor Hill moraine that traverses the length of Long Island. The moraine lies several miles north of the project site. South of the moraine, the complex rising and subsidence of the coastal plain, relieved of its glacial burden, and the rising sea level, caused by the volume of melting ice, created the coastline of embayed rivers and estuaries, with extensive marsh tracts, which stabilized approximately 3,000 years ago (Schuberth 1968).

D. Soils

According to the *New York City Reconnaissance Soil Survey* (Figure 3), the project site falls within four different soil mapping units.

The majority of the roadways within the project site are within soil mapping unit 211, Pavement & buildings-Flatbush-Riverhead complex, 0 to 8 percent slopes, described as:

[5] All project plans utilize the Borough of Queens Sewer/Highway Datum, which is 2.725 feet above mean sea level as established by the U.S. Coast and Geodetic Survey at Sandy Hook, New Jersey (also known as the NGVD29 Datum). For reference, the Borough of Queens Sewer/Highway Datum is 1.625 feet above the NAVD88 Datum, which is the preferred Datum for New York City according to the 2018 LPC *Guidelines for Archaeological Work in New York City*.

> Nearly level to gently sloping urbanized areas of outwash plains that have been substantially cut and filled, mostly for residential use; a mixture of anthropogenic and gneissic outwash soils, with up to 80 percent impervious pavement and buildings covering the surface (U.S.D.A. 2005:14).

The Brookville Park portion of the project site, including BMP #1 and WEA #1, is within soil mapping unit 225, Plymouth-Flatbush-Pavement & buildings complex, 0 to 8 percent slopes, described as:

> Nearly level to gently sloping areas of outwash plains that have been partially disturbed, mostly for parks and cemeteries; a mixture of sandy outwash soils and anthropogenic soils, with more than 15 percent impervious pavement and buildings covering the surface; located south of the terminal moraine in Queens (U.S.D.A. 2005:14).

BMPs #2 and #3, and WEAs #2 and #3 are within soil mapping unit 6, Ipswich-Pawcatuck-Matunuck mucky peats, described as:

> Low lying areas of tidal marsh that are inundated by salt water twice each day at high tide, with a mixture of very poorly drained soils which vary in the thickness of organic materials over sand (U.S.D.A. 2005:11).

Last the southernmost portion of the project site, at the intersection of Brookville Boulevard and Rockaway Boulevard, is at the junction of mapping unit 6, above, and mapping unit 100, Inwood-Laguardia-Ebbets complex, 0 to 8 percent slopes, described as:

> Nearly level to gently sloping areas that have been filled with a mixture of natural soil materials and construction debris; a mixture of anthropogenic soils which vary in coarse fragment content (U.S.D.A. 2005:12).

There have been several programs of soil borings completed at various locations across the project site. The most comprehensive program of geotechnical soil borings included 118 individual borings undertaken in 2013 and 2014 and documented in a geotechnical report by CDM Smith in 2015. These borings were completed within the project site roadways and portions of BMP #1 and BMP #2. The map, coordinates, and boring logs for these 118 soil borings are included as Appendix C. All elevations in this soil boring program referred to the Borough of Queens Highway Datum, which is 2.725 feet above mean sea level at Sandy Hook as established by the U.S. Coast & Geodetic Survey (NGVD29 Datum), or 1.625 feet above the NAVD88 Datum.

Results of the 118 soil borings were largely consistent. Nearly every boring within roadways recorded a thick upper stratum of fill beneath the pavement, several feet in extent, followed by strata of naturally occurring sandy soils with traces of silt and gravel. Outside of roadways, many borings also recorded a thick fill overmantle, although in some cases the drillers did not record the soil characteristics of the first 6 feet of soil, as per DDC guidelines. The lower reaches of the soil borings recorded natural sandy soil strata, with traces of silt and gravel. None of the soil borings recorded bedrock. The soil borings mostly ranged in depth from 42-102 feet below grade, with the ground surface elevations varying across the project site. Where measured, the groundwater depth generally was within 1 foot of zero elevation. Of note, within those soil borings located in or near current marshlands, there was no mention of a noticeable peat stratum (some borings noted only traces of organics), nor were there mentions of noticeable concentrations of shells or other organic materials that could indicate a precontact period archaeological midden deposit or a capped precontact surface.

Two additional sets of soil borings were completed in conjunction with environmental studies. In 2006, Louis Berger & Associates completed a Corridor Assessment Report and a Limited Subsurface Corridor Investigation for portions of the project's street corridors (LBA 2006a, 2006b). Four soil borings were completed within selected roadways at that time. A second set of 45 soil borings was completed within and adjacent to project roadways in conjunction with a Phase II subsurface corridor investigation in 2019, also by Louis Berger & Associates. Both of these sets of soil borings were completed in order to assess

hazardous materials in the soils rather than for geotechnical conditions, and so were not as deeply excavated. The data from the 2006 and 2019 soil borings were largely similar to those of the upper reaches of the geotechnical borings. As well, none of these borings recorded any strata that could correspond to a Buried A horizon, had levels of peat, or recorded or any concentrations of shells that could suggest a midden deposit.

IV. BACKGROUND RESEARCH/HISTORICAL OVERVIEW

A. Precontact Period Summary

For this report, the word precontact is used to describe the period prior to the use of formal written records. In the western hemisphere, the precontact period also refers to the time before European exploration and settlement of the New World. Archaeologists and historians gain their knowledge and understanding of precontact Indigenous Peoples (Native Americans) in the greater metropolitan New York area from three sources: ethnographic reports, Native American artifact collections, and archaeological investigations.

Based on data from these sources, a precontact cultural chronology has been devised for the New York City area. Scholars generally divide the precontact era into three main periods, the Paleo-Indian (c. 14,000-9,500 years ago), the Archaic (c. 9,500-3,000 years ago), and the Woodland (c. 3,000-500 years ago). The Archaic and Woodland periods are further divided into Early, Middle, and Late substages. The Woodland was followed by the Contact Period (c. 500-300 years ago). Artifacts, settlement, subsistence, and cultural systems changed through time with each of these stages. Characteristics of these temporal periods have been well documented elsewhere, and in keeping with guidelines issued by the OPRHP (2005), will not be fully reiterated here.

Scholars often characterize precontact sites by their close proximity to a water source, fresh game, and exploitable natural resources (i.e., plants, raw materials for stone tools, clay veins, etc.). These sites are often separated into three categories: primary (campsites or villages), secondary (tool manufacturing, food processing), and isolated finds (a single or very few artifacts either lost or discarded). Primary sites are often situated in locales that are easily defended against both nature (weather) and enemies. Secondary sites are often found in the location of exploitable resources (e.g., shell fish, lithic raw materials).

B. Previously Recorded Archaeological Sites and Surveys

There have not been any archaeological sites specifically recorded within the project site boundaries. Within one mile of the project site, four New York State Museum (NYSM) sites have been recorded, but there is minimal information available about them and they are broadly drawn on the SHPO's Cultural Resource Information System (CRIS). NYSM Site 4547 was recorded by Arthur C. Parker in 1922 as "traces of occupation" along Hook Creek near the Nassau County border with Queens. The broad mapping of this site on CRIS overlaps with the southern extent of Brookville Avenue within the project site, but should not be considered a precise determination. In his archaeological study for Queens, Boesch (1997) documented one additional archaeological site, reported by Ralph Solecki in 1941, when the Belt Parkway was being constructed. Table 4, below, lists the sites within a one-mile radius of the APE.

Table 4: Archaeological sites within a one-mile radius of the APE

Site # and name	Distance from APE	Time Period	Site Name/Type
NYSM 4033	Ca. 0.8 mile southeast	Unknown precontact	Burial site
NYSM 4534	Ca. 0.3 mile northeast (location appears to be incorrect per NYSM database)	Unknown precontact	Village site
NYSM 4538 Boesch 63	Ca. 0.6 mile southwest	Unknown precontact	Habitation site

Site # and name	Distance from APE	Time Period	Site Name/Type
NYSM 4547 Boesch 21	Overlaps southern section of Brookville Road within the APE	Unknown precontact	Traces of occupation
Boesch 44 Hassock Creek - Springfield (QN-9)	Ca. 0.5 mile west	Unknown precontact and historic period	Assorted artifacts

Based on the distance of the project site to the broadly drawn boundaries of the NYSM sites, CRIS indicates that the majority of the project site is within a buffer zone surrounding these sites that could be archaeologically sensitive. However, Boesch's sensitivity study for Queens indicates that the entire project site is within an area of high archaeological sensitivity (Boesch 1997).

CRIS indicates that there have been four archaeological studies completed within a one-mile radius of the project site.

In 2009, the Institute for Long Island Archaeology completed a Cultural Resources Survey of the New York State Route 878 Operational Improvements, Rockaway Turnpike to Burnside Avenue, Inwood, Town of Hempstead, Nassau County, located approximately 0.7 mile southeast of the project site (Merwin 2009). No archaeological sites were found.

In 2017, HDR completed a Phase I Archaeological Investigation of the Queens Safety City Site on North Conduit Avenue at the intersection of 246th Street and 138th Avenue, approximately 0.6 mile northeast of the project site. Phase IB shovel testing revealed disturbance from dumping and no archaeological resources (HDR 2017).

In 2019, HPI conducted a Phase IA Archaeological Resources Assessment of the GOSR Green Infrastructure Assessment and Implementation Project at multiple locations in Kings and Queens Counties, New York. One of the loci, in the Idlewild neighborhood, is located ca. 0.4 mile northeast of the project site. No further investigations were recommended for the Idlewild project locus (HPI 2019).

Last, in 2020, HPI completed an Archaeological Documentary Study for the 225th Street Infrastructure Improvements, Queens County, New York, located approximately 0.3 mile southwest of the project site. The study recommended additional review of upcoming soil borings (HPI 2020).

C. Historic Period Summary

What is now the project site neighborhood was historically part of the area designated by the Dutch as Rustdorp ("rest-town"), which encompassed all of southern Queens. In 1655, it was settled by English colonists from Massachusetts and Heemstede (Hempstead in present Nassau County), who requested permission from Director General Peter Stuyvesant to establish a town halfway between Hemstede and Amersfoort (Flatlands in Kings County). The settlers referred to the village as "jemeco" which was Delaware for beaver, due to its proximity to a beaver pond, and was later corrupted to Jamaica (Munsell 1882:192). Jamaica's proprietors purchased surrounding lands from Native Americans in order to strengthen the town's title to lands granted by the Dutch colonial government. The hamlet of Springfield, at the crossroads of what are now Merrick and Springfield Boulevards, was settled equally early (Munsell 1882:198).

After the British established rule in 1664, New Amsterdam became "New York" and Long Island became "Yorkshire," with Yorkshire being divided into "ridings" or thirds. Jamaica became part of the "North Riding" (Seyfried and Asadorian 1991:vi). In 1683, the system of ridings was abolished under Governor Thomas Dongan, and ten counties were created; three on Long Island. It was at that time that Kings, Queens, and Suffolk Counties came into existence, and Rustdorp was renamed Jamaica.

During the colonial era, many of the streams in lower Queens were dammed and mills were built on them. Conselyea's Creek and Pond were named for the Conselyea family, who dammed the waterway flowing through the project site and erected a saw mill and a grist mill during the eighteenth century, both outside the project site limits, north of what is now 147th Avenue. There were two roadways leading to and from the mills. The nearest hamlet to the project site was the settlement of Springfield, approximately one-half mile to the northwest, situated along Thurston's Creek. A roadway led from Springfield southeast to the project site area, on an alignment north of present 147th Avenue. The other roadway within the project site during this period was a section of what is now known as Brookville Boulevard, but which was originally called Fosters Meadow Road. The road was named after the community of Fosters Meadow, which included land to the northeast of the project site in both what are now Queens and Nassau Counties, with northern Fosters Meadow lying in Nassau. When first settled in ca. 1650 by Thomas and Christopher Foster, the family used the western tip of the Hempstead Plains as a sheep pasture (Munsell 1882:201). The 1781 Taylor and Skinner map illustrated the communities of Springfield, Fosters Meadow, the mill pond along Conselyea's Creek, and the only two roadways that existed in the project site vicinity at that time. Fosters Meadow Road terminated south of the project site at the edge of the marshland.

The project site and vicinity remained very sparsely developed during the first half of the nineteenth century. The land surrounding the marshlands was used for farming and woodland, with only scattered buildings along the few local roads. By the 1830s, a roadway had been constructed through the marshlands, connecting Jamaica on the northwest with Far Rockaway on the southeast. Known initially as the Rockaway Road and later the Rockaway and Jamaica Turnpike, it ran south of the project site, largely within the area now covered by JFK International Airport (Bellot 1917:85). Several 1837 U.S.C.S. maps, as well as the 1845 U.S.C.S. map, showed the route of this roadway. By the early 1850s, Fosters Meadow Road may have been been extended through the marshlands to reach the Rockaway Road, connecting the project site with communities to the south and east. The 1852 Conner map (Figure 4) showed the extent of development by this period. The saw and grist mills were depicted at the southern end of Conselyea's Pond, and a scattering of structures were shown along and in proximity to the local roadways, although the scale of the map is such that the precise placement of the buildings in relation to the modern roads is unclear. Curiously, this map, as well as the subsequent 1859 and 1863 Walling maps, showed that Fosters Meadow Road ran in a straight line through the marshland in what is now Hook Creek Park to connect with Rockaway Road. Other historic maps (e.g. Beers 1873, Figure 5; Beers 1886; Wolverton 1891, Figure 6) did not show this roadway in place, suggesting that the earlier maps may have been in error, the later maps were incomplete, or that the roadway was short lived.

The 1873 Beers map (Figure 5) illustrated several changes to the project site area. By this time, the earlier road from Springfield to the saw and grist mills at the southern side of Conselyea's Pond was no longer shown, but a new alignment, roughly following the modern route of 147th Avenue, had been constructed, and several buildings had been erected on either side of the new roadway. Neither the mills nor the mill pond were shown, although a building was still attributed to the Conselyea family. The creek was called Simonsons Creek at this time. The other change shown on the 1873 Beers map was the presence of a railroad line crossing diagonally through the northeastern end of the project site. This was a short-lived branch of the Long Island Railroad that ran from Jamaica to Far Rockaway during the 1870s (Ross 1903). The modern roadways of Edgewood Street and Huxley Street, which are oriented at an angle to the rest of the street grid, border the former railroad alignment. In 1918 and again in 1928, the Long Island Railroad rebuilt the tracks as the Cedarhurst Cutoff, but the project was soon abandoned again and the tracks removed (Walsh 2014).

Another change to Conselyea's Creek had occurred in the 1850s, when the Nassau Water Works Company, which supplied the city of Brooklyn with water, began to purchase the water rights to many of the fresh water streams and extant mills in eastern Queens, including the supply along Conselyea's or Simonson's Creek (Munsell 1882:202). An east-west arched brick conduit was constructed running from the Hempstead Reservoir to Ridgewood Reservoir along present-day Sunrise Highway, and collected water from the dammed streams that crossed it, including Simonson's Creek. The 1891 Wolverton map (Figure 6) indicated that the area north of 147th Avenue was now attributed to the City of Brooklyn, and a pumping station was located along the creek. The map also continued to show that the overall project area was still mostly undeveloped and likely used for farmland and woodland, with only a scattering of buildings along

what is now Brookville Boulevard and 147th Avenue. Similar conditions were shown on the 1897 U.S.G.S. map (Figure 7), the 1901 Hyde map, and the 1909 Bromley map (Figure 8).

After Queens became a borough New York City in 1898, a street grid was projected across the project area, but it was many years before the new streets were realized and new development began. A 1924 aerial photograph (Figure 9) showed that other than Brookville Boulevard and 147th Avenue, there were still no other roadways within the project site. Only a few scattered buildings were located along these two roads. The majority of the upland portions of the project site were shown as farmland. Most of the area now within Brookville Park, Idlewild Park, and Hook Creek Park was shown to be marshland. The few locations within the project site that were developed enough to merit inclusion on the 1926 Sanborn Fire Insurance maps indicated similar conditions as the 1924 aerial photograph. Although some additional streets and blocks were shown in 1926, many of these existed only on paper.

Additional project site streets began to be constructed during the 1930s and 1940s, and gradually buildings were erected along them. Tax photographs made in 1939-1941 captured some of the modest residences along these streets. Most of the buildings were frame constructed, and a number appeared to be set on raised piers, perhaps to address a high water table or flooding in these low-lying areas. The 1947 U.S.G.S. map (Figure 10) and 1951 Sanborn Insurance map sheets showed the pace of development in the area, and suggested that many of the streets had not yet been paved. The southeast quadrant of the project site, along both sides of Brookville Boulevard, still was shown primarily as open space without many cross streets.

Also during the mid-1940s, construction began on what was originally known as Idlewild Airport, the precursor to today's JFK International Airport. Work started in 1943 and the airport opened in 1948. The 1947 U.S.G.S. map (Figure 10) labeled this as "Jamaica Airport." In 1947, the Port of New York Authority (today known as the Port Authority of New York and New Jersey) leased the airport from the city. One of the first projects the Port of New York Authority undertook was to create two new runways oriented northeast-southwest at the southeastern end of the airport property. The approach to these runways was over what is now Idlewild Park. In order to preserve open space and prevent future residential development in these areas, the Port of New York Authority began purchasing land in what is now Idlewild Park in the 1940s, including portions in the project site vicinity. The tidal marshlands, which in the thinking of that period were considered to be worthless in their natural condition, were slated for land reclamation through filling with refuse and construction waste (Vollmer Associates 1981: VI-32-33).

As part of the buildout of the airport, Rockaway Boulevard, which had previously crossed through the center of the airport property, was reconstructed on a new alignment north of its original location, in an area previously covered by marshland. The portion of the project site where Brookville Boulevard intersects Rockaway Boulevard was constructed by the early 1950s, although Rockaway Boulevard was subsequently widened. In 1958, the assignment of Idlewild Park was transferred from the Port of New York Authority to the New York City Parks Department. The portion of Brookville Park north of 147th Avenue, which was already city property after being acquired for the municipal waterworks, was acquired by the Parks Department at about the same time. The portion south of 147th Avenue was added by the 1980s.

The remainder of the project site streets, including those located east of Brookville Boulevard, were constructed by the 1960s, and new housing stock was erected along these roadways. During the 1960s and 1970s, Idlewild Park and Brookville Park continued to be used for landfilling purposes, both at the municipal level and informally by local residents. The city used the southern portion of the marshlands in Idlewild Park, to the southwest of the project site, for a construction debris landfill, while many residents and businesses wishing to dispose of household and commercial trash often used the northern area of the park, which was accessible from local roads, as private, illicit dumping grounds (Hendrick 2002). A series of photographs taken in 1966 of the area, and on file with the New York City Parks Department, showed the extent of the illegal dumping activities in Brookville Park (Appendix D). The city's landfill site in Idlewild Park was closed after 1974 (Vollmer Associates 1981: VI-35). Aerial photographs show that in addition, by the mid-1960s an aviation beacon facility atop a landfilled platform had been constructed in Brookville Park at the western terminus of 148th Drive, where BMP #2 is proposed.

In addition to the airport construction and landfilling activities in the post-World War II period, the project site vicinity was affected by proposed plans for the Nassau Expressway. This highway was envisioned to run from the Brooklyn-Queens border through Queens and into Nassau County. Initial plans for the Nassau Expressway route in the 1940s and 1950s were just south of the present Rockaway Boulevard, within the JFK International Airport property. As the airport expanded and safety issues concerning flight patterns became more prevalent, the proposed alignment of the Nassau Expressway was shifted north, into Idlewild Park. Construction of the eastbound portion of the highway from Cross Bay Boulevard to the Van Wyck Expressway began in 1965, opening in 1967. However, the remaining segment of the highway, including the area in Idlewild Park, was not built at that time due to a number of reasons, including community opposition. During the late 1970s additional alternatives were studied in an Environmental Impact Statement (EIS) and Section 4f study, culminating in a Final EIS in 1981 by Vollmer Associates. The alternative chosen for the Nassau Expressway was mapped as running through Idlewild Park, north of the city landfill extent, as shown on an aerial photograph from 1981 (Figure 11). The Nassau Expressway project ultimately did not move forward after 1981. The 1981 aerial photograph also showed the addition to Brookville Park south of 147th Avenue, and the future Hook Creek Park, here labeled a "Public Place." The photograph also showed that the former marshland areas proposed for BMP #1, WEA #1, and WEA #3 clearly had been landfilled.

There have been some new facilities constructed in Brookville Park since the 1980s, including several athletic fields outside the project site. There has been maintenance work completed at and around Conselyea's Pond and Creek, and at 147th Avenue where a new culvert and outfalls have been constructed at the road crossing. Many of the roadbeds have had utility work completed, as evidenced by asphalt replacement at those locations. At the time of the site visit, reconstruction of portions of the western end of 147th Avenue was underway. However, there has not been significant change to the project site roadways and proposed BMP and WEA locations during the last few decades.

V. CONCLUSIONS

The purpose of this Phase IA Archaeological Documentary Study was to determine whether archaeological resources from Native American and historical period occupations could have been deposited in the project site, if they could have remained intact, surviving later historical development and disturbance, and if any potential resources could be impacted by proposed project plans. The following sections outline the conclusions for these resources.

A. Precontact Archaeological Sensitivity

From what is known of precontact period settlement patterns on Long Island, most habitation and processing sites are found in sheltered, elevated sites close to wetland features, major waterways, and with nearby sources of fresh water. The project site once contained a combination of firm ground and natural marshlands surrounding tidal creeks. Native Americans would have been drawn to these creeks and marshlands for their aquatic life, wild game, and vegetation. As well, wetlands provided peat that could be used for fuel and a number of plants that served as materials for clothing, basketry and weaving. As importantly, the use of certain aquatic plants for medicinal purposes is ethnographically documented (Herrick 1995).

Precontact period sites, primarily from the Woodland Period, have been documented along the Jamaica Bay shoreline in proximity to marshlands. In some cases, extensive shell middens extended into the marshlands, the equivalent of precontact garbage dumps. Defined as deposits of shells, gravel, sand and silt and in some cases other cultural remains, they occur either as distinct cultural events or in association with habitation sites (Wells 2001). Along some areas of Jamaica Bay, these shell middens have been found under layers of modern fill, but on top of marshland soils (Pickman 1987:4). Additionally, prior to the creation of Jamaica Bay and its marshlands after the last Ice Age, the entire project site would have been dry land. It is possible that precontact period archaeological sites from this period, dating from the Paleo Indian period through parts of the Archaic period, could remain capped by later marshland soils that accrued after the sea level rise, ca. 2000-4000 B.P.

Despite the generalized potential precontact period archaeological sensitivity for the Jamaica Bay vicinity, a number of factors argue against this sensitivity for the project site itself. The majority of the roadways within the project site were once on firm ground, in proximity to marshlands. However, there has been significant disturbance to these roadway locations from the grading and filling activities necessary to create the roads, as well as the installation of multiple subsurface utilities beneath the roads. Over 100 soil borings from the roadways across the project site (taken outside of the utility footprints which would have been completely disturbed) indicated that there were no obvious soil strata that could have suggested precontact period occupation, such as lenses of dark soil suggesting a Buried A horizon, or concentrations of shell and organic materials that might have been markers of shell middens. The BMP and WEA locations were all once within marshlands that formed after the last Ice Age, and so would have been less likely to contain precontact resources. Today these marshlands have been covered with fill and debris, which were deposited using heavy machinery, causing disturbance to the natural landform. Soil borings within the BMPs did not record any concentrations of shell and organic material, which might have indicated shell middens, nor did they record any layers of peat, which may have capped an earlier landform from a time when these areas were dry land. Finally, there have not been any previous precontact period archaeological sites recorded within the project site or in close proximity. Most of the precontact sites that were previously noted in the Jamaica Bay area were recorded over a century ago, in a period prior to the widespread development that has characterized the area since that time.

For these reasons, HPI concludes that the project site has a low precontact period archaeological sensitivity.

B. Historic Period Archaeological Sensitivity

The project site and vicinity were minimally developed prior to the second half of the twentieth century. Among the earliest uses of the project site vicinity was for a saw mill and grist mill, located at the southern end of the artificially dammed Conselyea's Pond, but well outside the project site boundaries. Prior to the creation of the current city street grid, the project site was mostly used for farmland and woodland. There were only a scattering of buildings along the two main roads of Brookville Boulevard and 147th Avenue. Historic maps suggest that none of these buildings were within the footprints of the current project site streets, nor were their immediate yards where any archaeological deposits would be anticipated. The buildings generally were set back from the main roadways, often on multiple-acre tracts. Furthermore, the BMP and WEA locations were once within marshlands and were not developed or otherwise occupied.

Given these factors, HPI concludes that the project site has a low historic period archaeological sensitivity.

VI. RECOMMENDATIONS

Based on the conclusions outlined above, HPI recommends that no additional archaeological investigations are warranted for the project site.

PLAN

SCALE: 1" = 30'

NOTES APPLICABLE TO ALL SHEETS:

1. THE "SPOT REPAIR" AS NOTED ON THE CONTRACT DRAWINGS SHALL MEAN THAT THE EXISTING SEWER AT THAT LOCATION SHALL BE REPLACED IN KIND TO THE EXTENT SHOWN ON THE PLANS.
2. THE COST OF SEWER REPLACEMENT UNDER "SPOT REPAIR" SHALL BE PAID UNDER APPLICABLE NEW SEWER BID ITEMS.
3. THE CONTRACTOR SHALL BE REQUIRED TO TELEVISE THE CONDITION OF EXISTING SEWER BEFORE AND AFTER THE "SPOT REPAIR" WORK IS COMPLETED. THE COST OF THIS TV INSPECTION SHALL BE PAID UNDER THE RESPECTIVE BID ITEM.
4. THE CONTRACTOR SHALL PROVIDE SPURS, AND RECONNECT EXISTING HOUSE CONNECTIONS DUE TO THE SCOPE OF THE "SPOT REPAIR" WORK. THE COST OF THIS SHALL BE PAID UNDER THE RESPECTIVE BID ITEMS.

NOTES APPLICABLE TO ALL SHEETS:

1. THE "SPOT REPAIR" AS NOTED ON THE CONTRACT DRAWINGS SHALL MEAN THAT THE EXISTING SEWER AT THAT LOCATION SHALL BE REPLACED IN KIND TO THE EXTENT SHOWN ON THE PLANS.
2. THE COST OF SEWER REPLACEMENT UNDER "SPOT REPAIR" SHALL BE PAID UNDER APPLICABLE NEW SEWER BID ITEMS.
3. THE CONTRACTOR SHALL BE REQUIRED TO TELEVISE THE CONDITION OF EXISTING SEWER BEFORE AND AFTER THE "SPOT REPAIR" WORK IS COMPLETED. THE COST OF THIS TV INSPECTION SHALL BE PAID UNDER THE RESPECTIVE BID ITEM.
4. THE CONTRACTOR SHALL PROVIDE SPURS, AND RECONNECT EXISTING HOUSE CONNECTIONS DUE TO THE SCOPE OF THE "SPOT REPAIR" WORK. THE COST OF THIS SHALL BE PAID UNDER THE RESPECTIVE BID ITEMS.

GENERAL NOTES

TOPOGRAPHIC NOTES:

1. ALL ELEVATIONS REFER TO THE BOROUGH OF QUEENS SEWER DATUM WHICH IS 2.725 FEET ABOVE MEAN SEA LEVEL AS ESTABLISHED BY THE U.S. COAST AND GEODETIC SURVEY AT SANDY HOOK, NEW JERSEY.

2. EXISTING TOPOGRAPHIC CONDITIONS OF THE WORK SITE, AS SHOWN ON THE CONTRACT DRAWINGS, ARE OBTAINED FROM THE MOST CURRENT INFORMATION AVAILABLE BUT ARE NOT GUARANTEED TO BE ACCURATE. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO VERIFY EXISTING AND PROPOSED GRADES.

UTILITY NOTES:

3. EXISTING UNDERGROUND AND OVERHEAD UTILITIES AS SHOWN OR DESCRIBED HEREIN HAVE BEEN DETERMINED BY STANDARD SURVEYING METHODS, FIELD RECONNAISSANCE AND AVAILABLE RECORDS. NEITHER THE EXACT LOCATION NOR THE INFORMATION OF THESE EXISTING UTILITIES IS GUARANTEED TO BE COMPLETE OR CORRECT.

4. EXCAVATION AND FILL IN AREAS WHERE UTILITIES ARE PRESENT SHALL BE DONE WITH UTMOST CARE. IT IS THE CONTRACTOR'S RESPONSIBILITY TO MAINTAIN EXISTING GAS, ELECTRIC, TELEPHONE, COMMUNICATIONS, SEWER, AND WATER LINES. ANY DAMAGE OR INJURY RESULTING FROM THIS OPERATION TO UTILITY LINES SHALL BE REPAIRED IMMEDIATELY AT NO COST TO THE CITY.

5. THE CONTRACTOR SHALL COORDINATE HIS WORK WITH UTILITY COMPANIES AND AGENCIES PRIOR TO THE START OF WORK.

EROSION AND SEDIMENT CONTROL:

6. THE IMPACTS TO ADJACENT NATURAL AREAS DUE TO EROSION AND SEDIMENTATION FROM SEWER INSTALLATION AND ASSOCIATED BMP CONSTRUCTION WITHIN THIS CONTRACT SHALL NOT BE ANY GREATER DURING AND FOLLOWING LAND DISTURBANCE ACTIVITIES THAN UNDER PRE-CONSTRUCTION CONDITIONS.

7. EROSION AND SEDIMENT CONTROL MEASURES SHALL BE CONSTRUCTED PRIOR TO BEGINNING ANY LAND DISTURBANCES AS REQUIRED BY THE SOIL EROSION AND SEDIMENTATION CONTROL PLAN. ALL RUNOFF FROM DISTURBED AREAS SHALL BE DIRECTED TO THE SEDIMENT CONTROL DEVICES. THESE DEVICES SHALL NOT BE REMOVED UNTIL THE DISTURBED LAND AREAS ARE STABILIZED.

8. ALL WORK PERFORMED SHALL BE IN ACCORDANCE WITH THE "NEW YORK STANDARDS AND SPECIFICATIONS FOR EROSION AND SEDIMENT CONTROL", 2005, OR LATEST EDITION.

GENERAL:

9. CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING ALL ITEMS REQUIRED TO COMPLETE ALL WORK ACCORDING TO PLANS AND SPECIFICATIONS.

10. SLOPE, X:Y, 

11. CONTRACTOR SHALL REPLACE ANY LOST OR DAMAGED SIGNS.

12. CONTRACTOR SHALL REPAINT ROADMARKINGS AFTER COMPLETION OF WORK.

13. BOULDER LOCATIONS AND QUANTITIES (AS SHOWN ON THE CONTRACT DRAWINGS) ARE APPROXIMATE. EXACT LOCATIONS AND QUANTITIES TO BE DETERMINED BY THE ENGINEER.

14. SIGN LOCATIONS (AS SHOWN ON THE CONTRACT DRAWINGS) ARE APPROXIMATE. EXACT LOCATIONS TO BE DETERMINED BY THE ENGINEER.

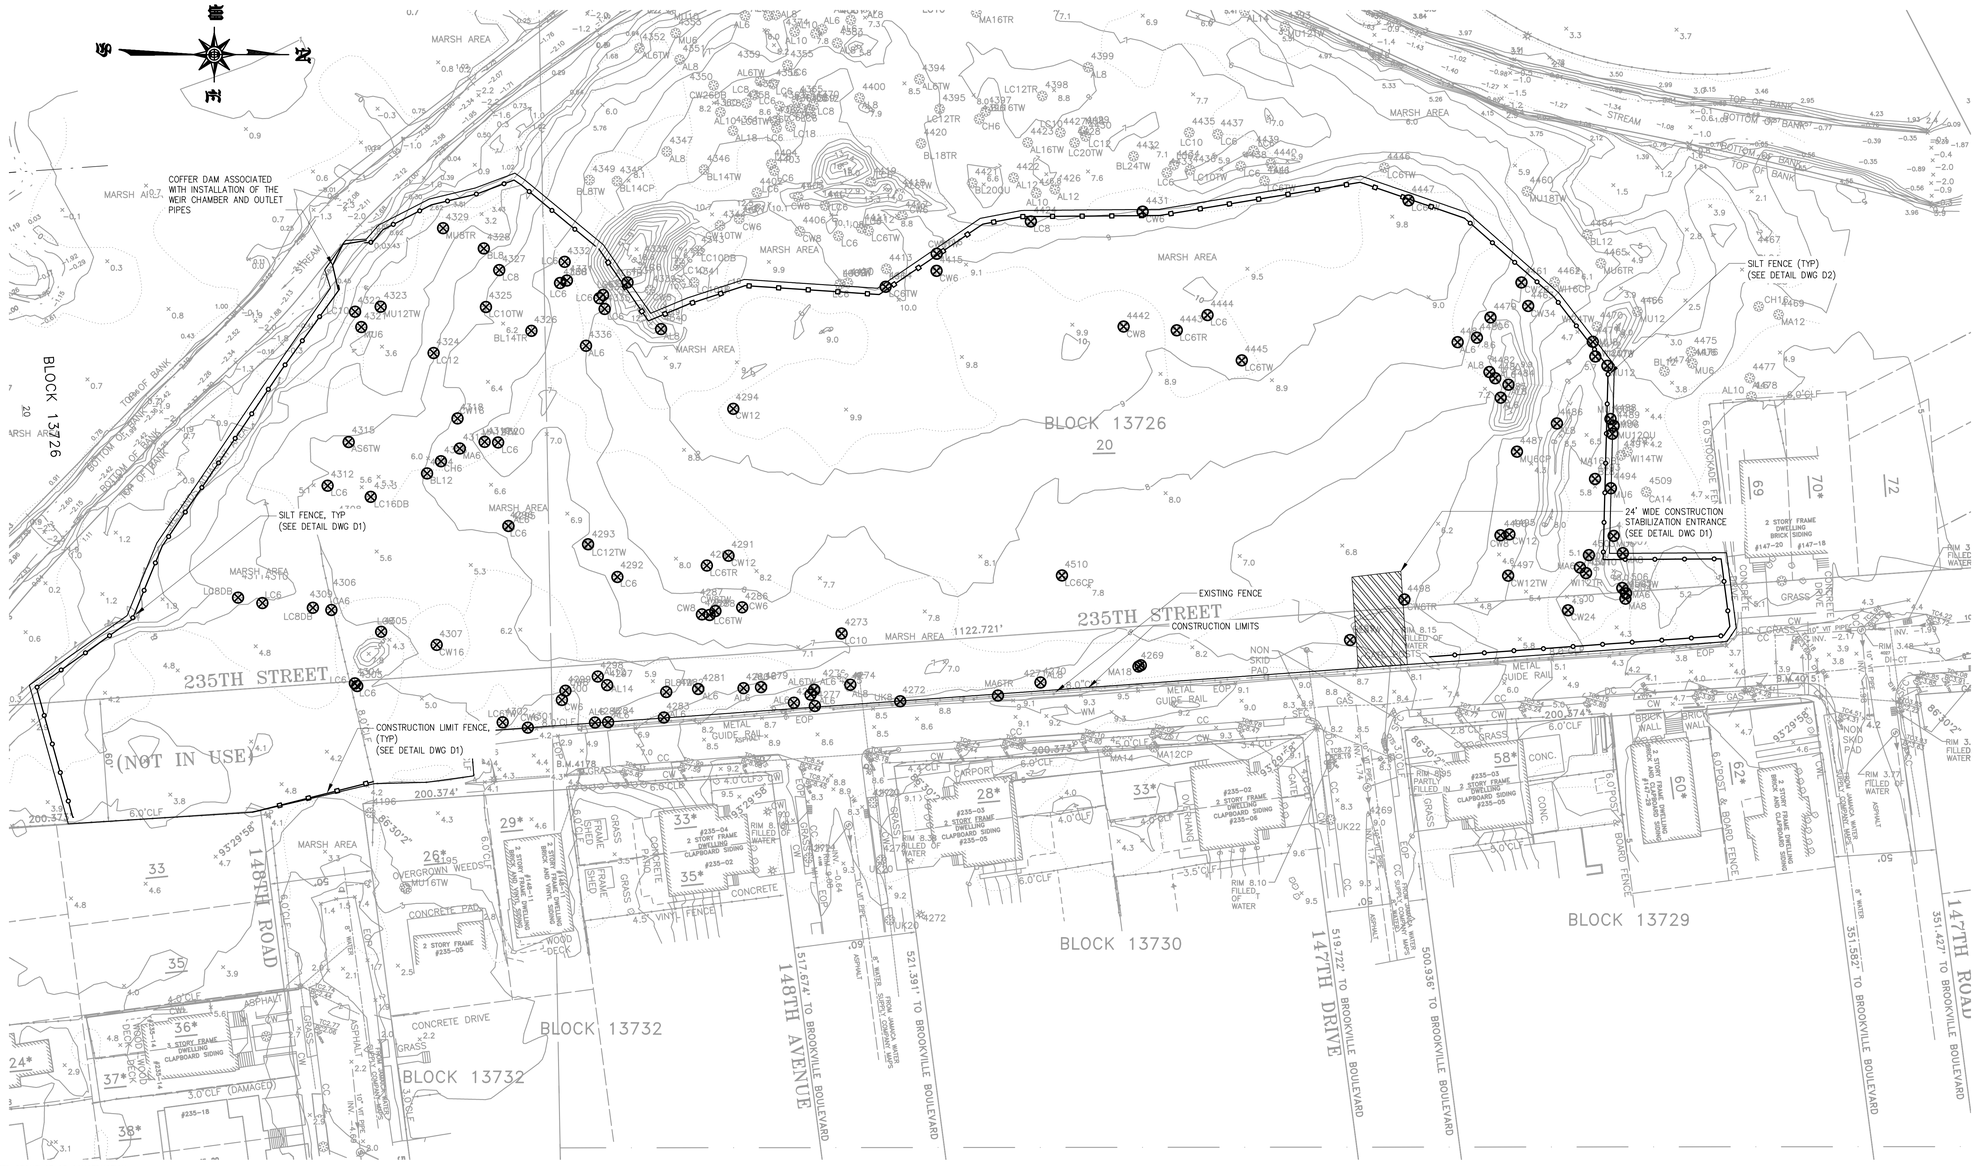
XREFs: 9781-037 TITLEBLOCK



PLAN

SCALE: 1" = 30'

1"=30'-0" 30 15 0 30'

SUGGESTED SEQUENCE OF CONSTRUCTION

ALL WORK SHALL BE COMPLETED IN ACCORDANCE WITH THE CONTRACT DRAWINGS, AND UPON APPROVAL OF THE PROJECT ENGINEER AND THE DDC REPRESENTATIVE. STAKE OUT AND RECEIVE APPROVAL FROM THE DDC REPRESENTATIVE FOR THE LIMITS OF WORK BEFORE BEGINNING CLEARING. THE DDC REPRESENTATIVE SHALL IDENTIFY ALL TREES TO RECEIVE TREE GUARDS AND GIVE APPROVAL FOR ALL TREES IDENTIFIED FOR REMOVAL BEFORE TREE REMOVAL OPERATIONS BEGIN.

A) INSTALL STABILIZED CONSTRUCTION ENTRANCE AT 235TH ST. INTERIOR ACCESS SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR.
B) INSTALL PERIMETER EROSION CONTROL MEASURES, INCLUDING REINFORCED SILT FENCES, CONSTRUCTION LIMIT FENCES AND TREE GAURDS. EXISTING FENCE SHALL REMAIN FOR USE AS CONSTRUCTION FENCE. PAYMENT SHALL ONLY BE MADE IF NEW CONSTRUCTION FENCE IS INSTALLED.
C) PERFORM GENERAL SITE CLEARING, GRUBBING AND REMOVALS
D) PRIOR TO INSTALLATION OF THE OUTLET STRUCTURE INSTALL A COFFER DAM, OR OTHER APPROVED METHOD FOR WORK WITHIN THE MARSH AREA.
E) INSTALL A SEDIMENT TRAP OR APPROVED EQUAL. A SEDIMENT TRAP SHALL BE USED TO TREAT THE DEWATERING EFFLUENT. IF THE SEDIMENT TRAP NEEDS TO BE PLACED OUTSIDE THE WORK AREA SHOWN, THE CONTRACTOR SHALL RECEIVE APPROVAL FROM THE ENGINEER PRIOR TO PLACEMENT AND THE NECESSARY PERIMETER EROSION AND SEDIMENT CONTROL MEASURES SHALL BE INSTALLED FOR THE NEW LOCATION. CONSTRUCTION MATERIALS INCLUDING BUT NOT LIMITED TO DEBRIS, SEDIMENTS AND FRESH CONCRETE SHALL BE PREVENTED FROM ENTERING THE WATERWAYS.
F) INSTALL APPROVED DEWATERING MEASURES, THE WORK AREA FOR THE INSTALLATION OF STRUCTURES SHALL NOT CONTAIN STANDING WATER.
G) MAINTAIN PUMPS ON SITE TO PUMP WATER FROM WORK AREAS DURING STORM EVENTS. DURING LARGE STORMS, ALLOW DEWATERING MEATURS TO OVERTOP AND DEWATER AS NEEDED PRIOR TO RESUMING CONSTRUCTION.
H) INSTALL STORM SEWERS
 1) INSTALL OUTFALL STRUCTURES
 2) INSTALL ROADWAY STORM SEWERS
I) PERFORM GRADING:
 1) MICROPOOL AT THE OUTLET STRUCTURE,
 2) BMP GRADING AND ACCESS ROADWAY
 3) INLET FOREBAYS
J) ONCE COMPLETE, INSTALL STABILIZATION MEASURES SUCH AS JUTE MESH OR EQUIVALENT AND SEEDING
K) INSTALL PERIMETER TREATMENT SUCH AS FENCING, GUARDRAILS AND SIGNS.
L) INSTALL LANDSCAPING
M) REMOVE EROSION CONTROL MEASURES

NOTES:
1. CONTRACTOR TO PROVIDE ROOT PROTECTION WITHIN THE TREE DRIP LINE FOR ALL TREES TO REMAIN.
2. TREES OUTSIDE THE LIMIT OF DISTURBANCE SHALL NOT BE DISTURBED AND SHALL BE REPLACED AT THE CONTRACTORS EXPENSE IF THEY ARE DAMAGED

PLAN

SCALE: 1" = 10'

1"=10'-0" 10 5 0 10'

SUGGESTED SEQUENCE OF CONSTRUCTION

ALL WORK SHALL BE COMPLETED IN ACCORDANCE WITH THE CONTRACT DRAWINGS, AND UPON APPROVAL OF THE PROJECT ENGINEER AND THE DDC REPRESENTATIVE. STAKE OUT AND RECEIVE APPROVAL FROM THE DDC REPRESENTATIVE FOR THE LIMITS OF WORK BEFORE BEGINNING CLEARING. THE DDC REPRESENTATIVE SHALL IDENTIFY ALL TREES TO RECEIVE TREE GUARDS AND GIVE APPROVAL FOR ALL TREES IDENTIFIED FOR REMOVAL BEFORE TREE REMOVAL OPERATIONS BEGIN.

A) CONSTRUCT ROADWAY
B) INSTALL STABILIZED CONSTRUCTION ENTRANCE AT 148TH AVENUE. INTERIOR ACCESS SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR.
C) INSTALL PERIMETER EROSION CONTROL MEASURES, INCLUDING REINFORCED SILT FENCES, CONSTRUCTION LIMIT FENCES AND TREE GAURDS.
D) PERFORM GENERAL SITE CLEARING, GRUBBING AND REMOVALS
E) INSTALL DEWATERING AS REQUIRED BASED ON FIELD VERIFIED GROUNDWATER ELEVATIONS.
   A) INSTALL A SEDIMENT TRAP OR APPROVED EQUAL. A SEDIMENT TRAP SHALL BE USED TO TREAT THE DEWATERING EFFLUENT. IF THE SEDIMENT TRAP NEEDS TO BE PLACED OUTSIDE THE WORK AREA SHOWN, THE CONTRACTOR SHALL RECEIVE APPROVAL FROM THE ENGINEER PRIOR TO PLACEMENT AND THE NECESSARY PERIMETER EROSION AND SEDIMENT CONTROL MEASURES SHALL BE INSTALLED FOR THE NEW LOCATION. CONSTRUCTION MATERIALS INCLUDING BUT NOT LIMITED TO DEBRIS, SEDIMENTS AND FRESH CONCRETE SHALL BE PREVENTED FROM ENTERING THE WATERWAYS.
   B) INSTALL APPROVED DEWATERING MEASURES.THE WORK AREA FOR THE INSTALLATION OF STRUCTURES SHALL NOT CONTAIN STANDING WATER.
   C) MAINTAIN PUMPS ON SITE TO PUMP WATER FROM WORK AREAS DURING STORM EVENTS. DURING LARGE STORMS, ALLOW DEWATERING MEATURS TO OVERTOP AND DEWATER AS NEEDED PRIOR TO RESUMING CONSTRUCTION.
F) PERFORM GRADING:
   A) SITE GRADING
   B) STILLING BASIN
G) ONCE COMPLETE, INSTALL STABILIZATION MEASURES SUCH AS JUTE MESH OR EQUIVALENT AND SEEDING
H) INSTALL PERIMETER TREATMENT SUCH AS FENCING, GUARDRAILS AND SIGNS.
I) INSTALL LANDSCAPING

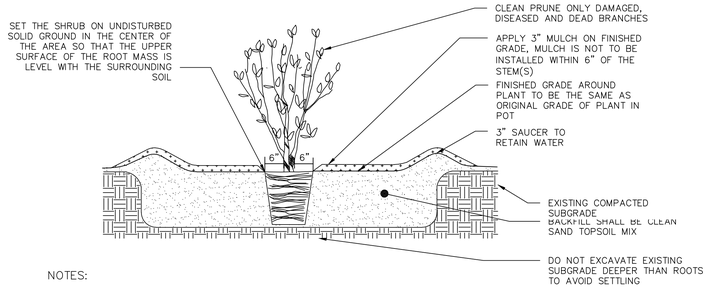
PLANTING HOLE -- GRASSES & FORBS, THROUGHOUT

SCALE: NOT TO SCALE

NOTES:
ALL PLASTIC WRAP SHALL BE REMOVED PRIOR TO PLANTING

FOR WETLAND PLANTING OMIT OSMOCOTE FERTILIZER.

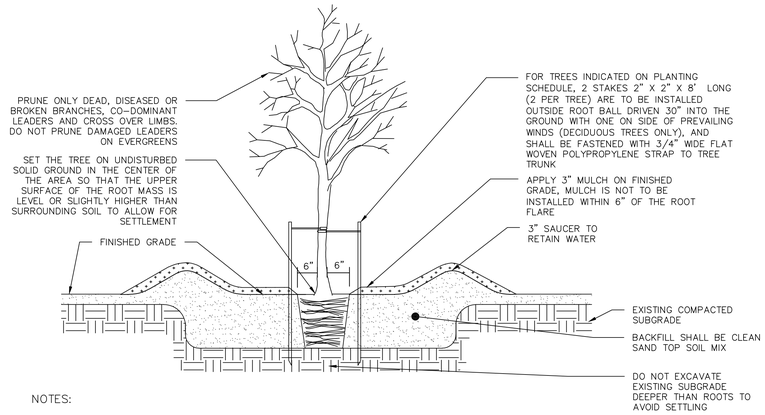


NOTES:

1. PRUNING, IF NECESSARY, SHALL BE DONE BY A CERTIFIED ARBORIST.
2. NOTIFY ENGINEER IF IMPERVIOUS OR UNACCEPTABLE NATIVE SOIL TO BE REMOVED IS ENCOUNTERED IN SHRUB PLANTING LOCATIONS.
3. ROTOTILL/CULTIVATE SOILS TO A DEPTH EQUAL TO THE DEPTH OF ROOT BALL AND TWO TIMES THE DIAMETER OF THE ROOT BALL.
2. APPLY FERTILIZER AND MYCORRHIZAL INOCULANT PER PLANTING SPECIFICATION. TAMP SOIL IN 6" LAYERS AROUND ROOT BALL AND WATER THOROUGHLY AFTER PLANTING. WATER THOROUGHLY AFTER EXCAVATION AND AFTER PLANT INSTALLATION.
3. CONTAINER: REMOVE ROOT BALL FROM CONTAINER. LOOSEN POT- BOUND, SPIRALLY-GROWING AND GIRDLING ROOTS. B&B: CAREFULLY REMOVE TOP 1/3 OF BURLAP. CUT SEVERAL SLITS IN BURLAP TO FACILITATE ROOT PENETRATION
4. REMOVE AND DISPOSE OF ALL NON-BIODEGRADABLES FROM PLANTING HOLES AND ROOT BALL.

TYPICAL SHRUB PLANTING DETAIL

NOT TO SCALE



NOTES:

1. PRUNING, IF NECESSARY, SHALL BE DONE BY A CERTIFIED ARBORIST.
2. NOTIFY ENGINEER IF IMPERVIOUS OR UNACCEPTABLE NATIVE SOIL TO BE REMOVED IS ENCOUNTERED IN TREE PIT LOCATIONS.
3. ROTOTILL/CULTIVATE SOILS TO A DEPTH EQUAL TO THE DEPTH OF ROOT BALL AND TWO TIMES THE DIAMETER OF THE ROOT BALL.
4. APPLY FERTILIZER AND MYCORRHIZAL INOCULANT PER PLANTING SPECIFICATION. TAMP SOIL IN 6" LAYERS AROUND ROOT BALL AND WATER THOROUGHLY AFTER PLANTING. WATER THOROUGHLY AFTER EXCAVATION AND AFTER PLANT INSTALLATION.
5. COMPLETELY UNWRAP OR CUT GIRDLING ROOTS. DO NOT DAMAGE MAIN ROOTS OR ROOT BALL WHEN INSTALLING TREE.
6. FOR CONTAINER: REMOVE ROOT BALL FROM CONTAINER. LOOSEN POT- BOUND, SPIRALLY-GROWING ROOTS. FOR B&B: CUT TWINE AND REMOVE BURLAP AND WIRE BASKET.
7. REMOVE AND DISPOSE OF ALL NON-BIODEGRADABLES FROM PLANTING HOLES AND ROOT BALL.
8. REMOVE STAKES AFTER FIRST YEAR.

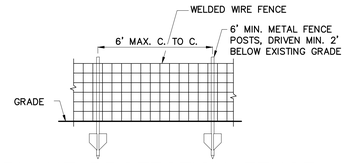
CONSTRUCTION LIMIT FENCE

NOT TO SCALE

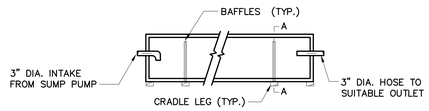
SPEC. SECT. 7.502



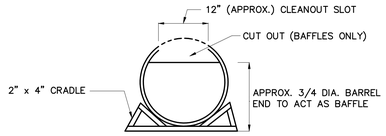
PLANT PROTECTION FENCE

NOT TO SCALE

SPEC. SECT. 7.410



LONGITUDINAL SECTION



GENERAL NOTES

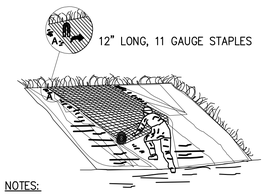
1. CLEAN OUT THE SEDIMENT TANK WHEN ONE THIRD (1/3) FILLED WITH SILT OR AS DIRECTED BY ENGINEER.
2. ALL SEDIMENT COLLECTED IN THE TANK SHALL BE DISPOSED OF OFF SITE AT AN APPROVED LOCATION.

SECTION A–A

PORTABLE SEDIMENT TANK

NOT TO SCALE

SPEC. SECT. 7.510



NOTES:

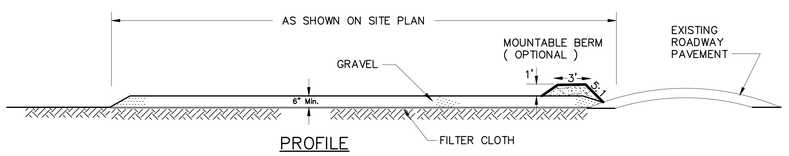
1. AREA SHALL BE CLEARED AND GRUBBED ACCORDING TO SPECIFICATIONS.
2. SEED BANK ACCORDING TO PLAN SPECIFICATIONS.
3. SECURE MATS/MESH AT THE TOP OF THE SLOPE BY TOEING IT IN AND REINFORCING IT WITH A ROW OF AT LEAST 5 STAPLES, SPACING EACH ONE APPROXIMATELY 8" APART.
4. PLACE STAPLES 18"–24" APART ALONG LENGTH OF MAT BLANKET TO SECURE TO THE SOIL SURFACE. ALL STAPLES MUST BE FLUSH TO THE SURFACE.

EROSION CONTROL MAT/ JUTE MESH

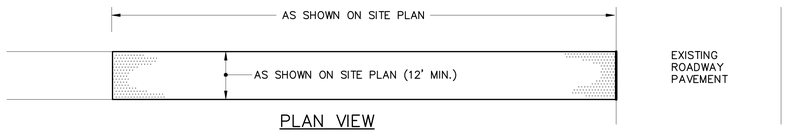
NOT TO SCALE

SPEC. SECT. 7.705 OR

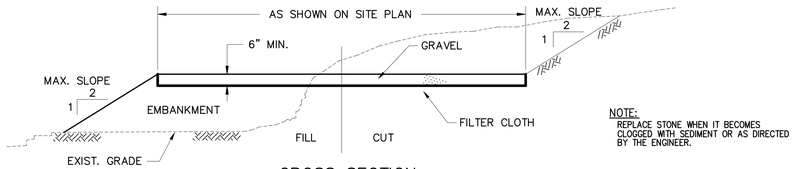
SPEC. SECT. 7.407



PROFILE



PLAN VIEW



NOTE:
REPLACE STONE WHEN IT BECOMES CLOGGED WITH SEDIMENT OR AS DIRECTED BY THE ENGINEER.

CROSS SECTION

STABILIZED CONSTRUCTION ENTRANCE

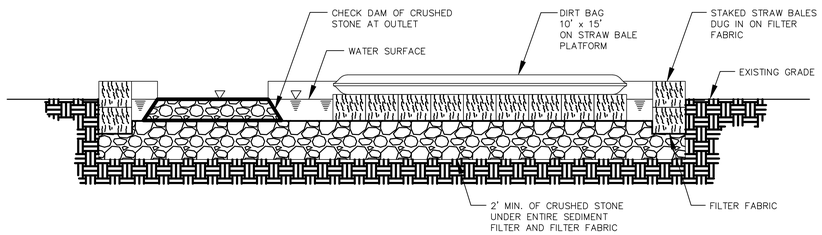
NOTE:
SEDIMENT FILTER SHALL BE
DUG IN BELOW EXISTING GRADE

PLAN

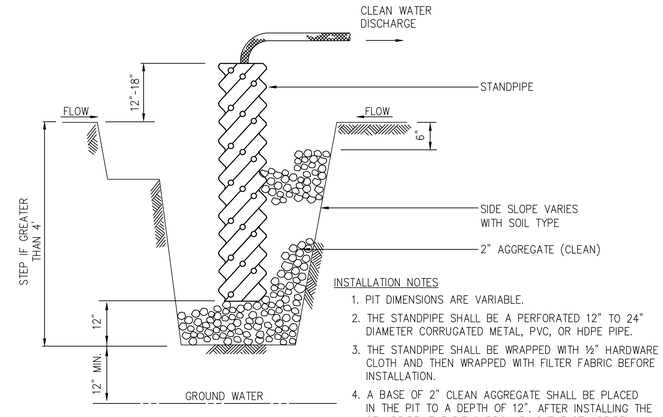


SECTION A–A

SEDIMENT TRAP (TYP.)

NOT TO SCALE

SPEC. SECT. 7.506 & 7.512



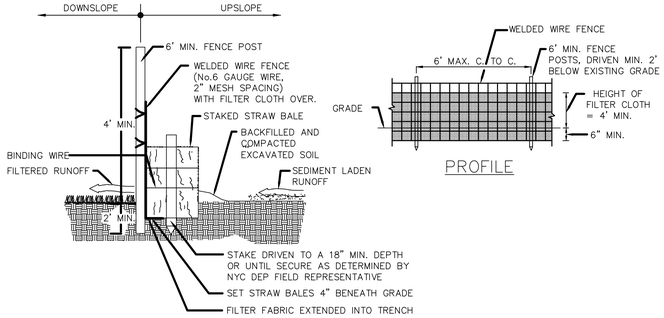
INSTALLATION NOTES

1. PIT DIMENSIONS ARE VARIABLE.
2. THE STANDPIPE SHALL BE A PERFORATED 12" TO 24" DIAMETER CORRUGATED METAL, PVC, OR HDPE PIPE.
3. THE STANDPIPE SHALL BE WRAPPED WITH ½" HARDWARE CLOTH AND THEN WRAPPED WITH FILTER FABRIC BEFORE INSTALLATION.
4. A BASE OF 2" CLEAN AGGREGATE SHALL BE PLACED IN THE PIT TO A DEPTH OF 12". AFTER INSTALLING THE STANDPIPE, THE PIT SURROUNDING THE STANDPIPE SHALL THEN, BE BACKFILLED WITH 2" AGGREGATE.
5. THE STANDPIPE SHALL EXTEND 12" - 18" ABOVE THE LIP OF THE PIT.

SUMP PIT DETAIL

NOT TO SCALE

SPEC. SECT. 7.102



NOTE: WEDGE LOOSE STRAW BETWEEN BALES

CROSS SECTION

PROFILE

CONSTRUCTION SPECIFICATIONS

1. WELDED WIRE FENCE TO BE FASTENED SECURELY TO FENCE POSTS WITH WIRE TIES.
2. FILTER CLOTH TO BE FASTENED SECURELY TO WOVEN WIRE FENCE WITH TIES SPACED EVERY 12" AT TOP AND MID SECTION.
3. WHEN TWO SECTIONS OF FILTER CLOTH ADJOIN EACH OTHER THEY SHALL BE OVERLAPPED BY SIX INCHES AND FOLDED.
4. MAINTENANCE SHALL BE PERFORMED REGULARLY AND MATERIAL REMOVED AS SPECIFIED.

REINFORCED SILT FENCE

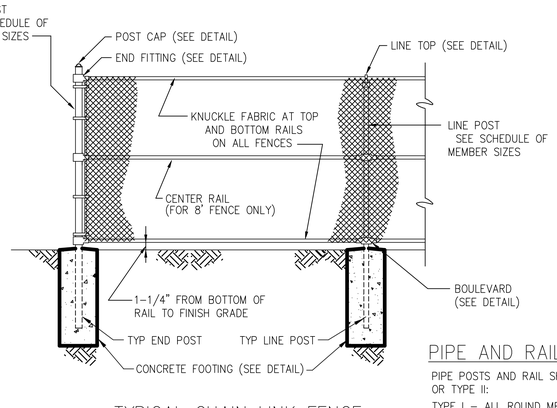
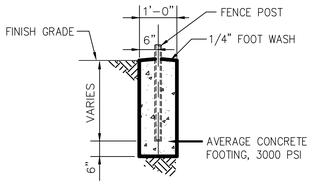
1. PROVIDE LATCHING DEVICES TO HOLD GATES IN OPEN POSITION AND PADLOCK MASTER LOCK NUMBER 12 OR EQUAL TO LOCK GATES CLOSED.



TYPICAL CHAIN LINK FENCE

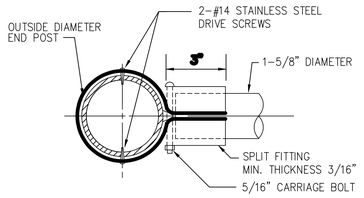
NOT TO SCALE

SPEC. SECT. 7.604



TYPICAL CONCRETE FOOTING FOR CHAIN LINK FENCE

NOT TO SCALE



NOTE: MINIMUM WIDTH OF END CLAMP TO BE 2 1/4"

END FITTING

NOT TO SCALE

PIPE AND RAIL NOTES

PIPE POSTS AND RAIL SHALL BE TYPE I OR TYPE II:

TYPE I – ALL ROUND MEMBERS SHALL BE GALVANIZED STEEL CONFORMING TO ASTM A-120, STANDARD WEIGHT SCHEDULE 40.

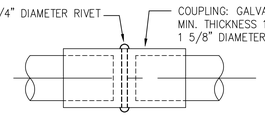
TYPE II – ALL ROUND MEMBERS SHALL BE COLD ROLLED WELDED STEEL CONFORMING TO ASTM A-569, TENSILE STRENGTH TO BE 60,000 PSI.

WIRE MESH NOTE

WIRE MESH SHALL BE PLACED ON THE OUTSIDE OF THE POSTS OF ALL EXTERIOR CHAIN LINK FENCES.

PIPE SCHEDULE	
NORMINAL OUTSIDE DIAMETER	ACTUAL OUTSIDE DIAMETER
1-5/8"	1.666
2"	1.9
2-1/2"	2.375

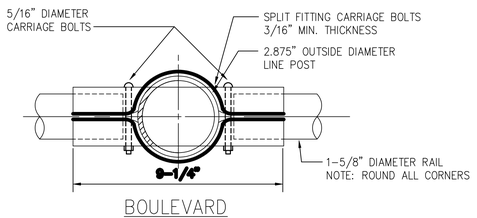
SCHEDULE OF SIZES OF MEMBERS						
HEIGHT OF FENCE	DIA OF LINE POSTS	MAX. POST SPACING	END POST	TOP RAIL	BOTTOM SPACING	DEPTH OF POST INTO CONCRETE FOOTING
4'-0"	2"	6'-0"	2-1/2"	1-5/8"	1-5/8"	1'-6"
6'-0"	2"	6'-0"	2-1/2"	1-5/8"	1-5/8"	2'-6"
8'-0"	2"	6'-0"	2-1/2"	1-5/8"	1-5/8"	2'-6"



NOTE: FURNISH ONE COUPLING FOR EACH LENGTH OF PIPE IN TOP RAIL. FULL LENGTH OF PIPE IS 21'-0"

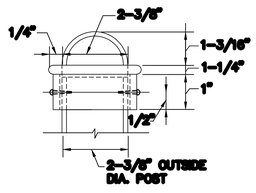
TOP RAIL COUPLING

NOT TO SCALE



BOULEVARD

NOT TO SCALE

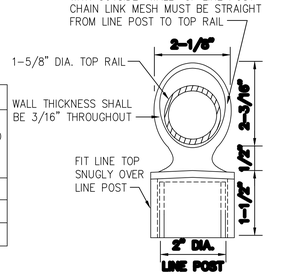


NOTE: POST CAP IS TO BE OF MALLEABLE IRON. CAP TOP FOR 4' HIGH CHAIN LINK FENCE TO BE A SMOOTH "DOME" SHAPE. FIT POST CAP SNUGLY OVER POST AND FIX IN PLACE WITH 2 #14 STAINLESS STEEL DRIVE OR SET SCREWS.

WALL THICKNESS SHALL BE 3/16" THROUGHOUT

SMALL POST CAP

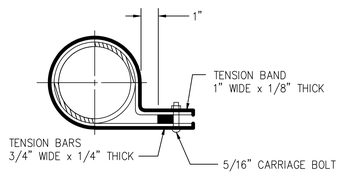
NOT TO SCALE



NOTE: WIDTH OF LINE TOP OVAL TO BE MIN. OF 5/8" AND A MAX OF 7/8"

LINE TOP

NOT TO SCALE



TENSION MEMBERS

DETAILS

RECONSTRUCTION OF BROOKVILLE BOULEVARD AND ADJOINING STREETS IN BROOKVILLE BOULEVARD AND EDGEWOOD TRIANGLE,NY
BOROUGH OF QUEENS

PROJECT ID: - HWQ724B | DATE: MAY 2019 | SHEET 20 OF 29 | D4/D4

CONSULTANT DESIGN

CAPITAL PROJECT HWQ724B

PLOT DATE: 05/03/2019 7:21P C:\9781-000-nyc\Drawings\9781-037 triangle\CIVIL\D-4 Civil Details.dwg Last Saved By: RMonley
XREFs: 9781-037 TITLEBLOCK

GENERAL NOTES:

1. FOR SITE, GRADES, SEE CIVIL PLANS

2. DESIGN LOADS:
   DEAD: SELF WEIGHT
   ROOF LIVE = AASHTO H-20 DESIGN TRUCK
   SOIL = 125 PCF
   VERTICAL CONSTRUCTION SURCHARGE = 600 PSF
   VERTICAL SERVICE SURCHARGE: 240 PSF
   LATERAL COEFFICIENT : Ko = 0.5

   SNOW LOAD:

   GROUND SNOW LOAD (Pg) = 20 PSF
   SNOW EXPOSURE FACTOR (Ce) = 0.9
   SNOW LOAD IMPORTANCE FACTOR (Is) = .80
   THERMAL FACTOR (Ct) = 1.20

   WIND DESIGN CRITERIA:

   BASIC WIND SPEED = 111 MPH
   RISK CATEGORY = I
   WIND EXPOSURE = C

   SEISMIC LOAD:

   RISK CATEGORY = I
   SEISMIC IMPORTANCE FACTOR (Ie) = 1.00
   SITE CLASS = E
   MAPPED SPECTRAL RESPONSE ACCELERATIONS (Ss/S1) = 0.257/0.068
   SPECTRAL RESPONSE ACCELERATIONS (SMS/SM1) = 0.660/0.255
   SPECTRAL RESPONSE COEFFICIENTS (SDS/SD1) = 0.440/0.170
   SEISMIC DESIGN CATEGORY = C

3. UNIT WEIGHTS
   CONCRETE: 150 PCF
   SOIL: 120 PCF
   STONE: 160 PCF
   WATER: 62.4 PCF

4. STRUCTURES HAVE BEEN DESIGNED FOR OPERATIONAL LOADS ON THE COMPLETED STRUCTURE. DURING CONSTRUCTION, THE STRUCTURES SHALL BE PROTECTED BY BRACING AND TEMPORARY SUPPORTS WHEREVER EXCESSIVE CONSTRUCTION LOADS MAY OCCUR. OVERSTRESSING OF ANY STRUCTURAL ELEMENT IS PROHIBITED.

5. NO BACKFILL SHALL BE PLACED AGAINST ANY SUBSTRUCTURE WALLS UNLESS ALL ADJACENT SUPPORTING ELEMENTS HAVE ACHIEVED DESIGN STRENGTH, OR WALLS HAVE BEEN PROPERLY BRACED, AND IN ANY CASE NOT SOONER THAN 28 DAYS AFTER THE PLACING OF CONCRETE UNLESS APPROVED BY THE ENGINEER. SUPPORTING ELEMENTS SHALL INCLUDE ADJACENT WALLS, SLABS, BEAMS AND COLUMNS.

METAL NOTES:

1. STEEL MATERIAL:
   A) STRUCTURAL TUBING: ASTM A500, GRADE B OR A501 (42 KSI)
   B) STRUCTURAL PIPE: ASTM A53, TYPE E OR S, GRADE B (35 KSI)
   C) PLATES AND ANGLES: ASTM A36 UNO (36 KSI)
   D) STRUCTURAL W SHAPES: ASTM A992 (50 KSI)
   E) STRUCTURAL S, M, C & H SHAPES: ASTM A572 GRADE 50 (50 KSI)

2. DO NOT PAINT STEEL SURFACES WHICH ARE TO BE WELDED OR ARE TO BE ENCASED IN CONCRETE.

3. ALL STAINLESS STEEL FABRICATIONS EXPOSED TO UNDERWATER SERVICE SHALL BE TYPE 316. ALL OTHER STAINLESS STEEL FABRICATIONS SHALL BE TYPE 304, UNLESS NOTED OTHERWISE.

4. ALL BOLTS, ANCHOR BOLTS, AND CONCRETE ANCHORS CONNECTING ALUMINUM SHALL BE TYPE 316 STAINLESS STEEL.

5. ALL GROOVE AND BUTT WELDS SHALL BE FULL PENETRATION.

6. FILLET WELD SIZES SHALL BE THE MINIMUM SIZE REQUIRED BY AISC CODE FOR PLATE SIZES TO BE CONNECTED AND SHALL BE APPLIED TO THE ENTIRE JOINT CONTACT LENGTH, BUT NOT LESS THAN 3/16".

7. STRUCTURAL WELDED JOINTS SHALL CONFORM TO THE PROVISIONS OF AWS D1.1, STRUCTURAL WELDING CODE BY AMERICAN WELDING SOCIETY. PROOF OF WELDER CERTIFICATION SHALL BE AVAILABLE AT THE JOB SITE DURING TIMES OF INSPECTION.

8. SPECIAL PERIODIC AND CONTINUOUS INSPECTIONS SHALL BE IN ACCORDANCE WITH SPECIFICATIONS AND THE BUILDING CODE OF THE CITY OF NEW YORK. PERIODIC INSPECTION OF STRUCTURAL STEEL CONNECTIONS, ROOF DECK, LIGHT GAGE STEEL FRAMING AND REINFORCING STEEL ARE REQUIRED.

CONCRETE NOTES:

1. ALL CONCRETE SHALL BE AIR ENTRAINED UNLESS DENOTED OTHERWISE ON DRAWINGS.

2. WHERE THE SPECIFICATIONS AND THE DRAWINGS DO NOT HAVE PROVISIONS, THE CONSTRUCTION SHALL BE IN ACCORDANCE WITH THE PROVISIONS OF "CODE REQUIREMENTS FOR CONCRETE STRUCTURES" (ACI 318 – LATEST EDITION).

3. FOR CONCRETE MIX DESIGN SEE GENERAL SPECIFICATION 11 – CONCRETE AS AMENDED BY THE NYCDEP BWSO-STANDARD SEWER AND WATER MAIN SPECIFICATION SECTION 2.15.

4. ALL REINFORCING BARS TO BE DEFORMED BARS OF NEW BILLET STEEL CONFORMING TO ASTM A615, GRADE 60. WHERE REINFORCEMENT IS TO BE WELDED IN ACCORDANCE WITH AWS D1.4, ASTM A706 GRADE 60 SHALL BE USED. WELDED WIRE FABRIC SHALL CONFORM TO ASTM A185.

5. MINIMUM COMPRESSIVE STRENGTH AT 28 DAYS:
   CAST-IN-PLACE CONCRETE: f'c = 4000 PSI.
   PRECAST CONCRETE: f'c = 5000 PSI

6. CONCRETE PROTECTION FOR REINFORCING SHALL BE AS FOLLOWS UNLESS OTHERWISE NOTED ON DRAWINGS:

   A. CONCRETE DEPOSITED DIRECTLY AGAINST SOIL _____ 3"
   B. CONCRETE EXPOSED TO WEATHER/FLUID _____ 2"

7. WHERE BARS ARE TO BE SPLICED OR EMBEDDED, THE LENGTH OF SPLICE OR EMBEDMENT SHALL COMPLY WITH THE LATEST EDITION OF THE MANUAL OF STANDARD PRACTICE OF THE AMERICAN CONCRETE INSTITUTE. FOR TENSION LAP SPLICES SEE TABLE ON SHEET SD-1 FOR CLASS B SPLICES.

8. ALL EXPOSED CORNERS SHALL HAVE A 3/4" CHAMFER UNLESS NOTED OTHERWISE ON DRAWINGS.

9. ALL EMBEDDED ITEMS SHALL BE INSTALLED AND SECURED IN PLACE BEFORE CONCRETE PLACEMENT. CONSULT APPROPRIATE DRAWINGS FOR PIPING, EMBEDDED ITEMS AND OPENINGS.

10. SLABS WITH SLOPING SURFACES SHALL HAVE THE INDICATED SLAB THICKNESS MAINTAINED AS THE MINIMUM. SLAB BOTTOMS CAN EITHER SLOPE WITH THE TOP SURFACE OR BE LEVEL. REINFORCEMENT IN SLABS WITH SLOPING SURFACES SHALL BE PLACED AT THE REQUIRED CLEARANCE FROM THE SLAB SURFACE.

11. ALL EXPOSED CONCRETE SHALL HAVE A PLYWOOD SMOOTH FORM FINISH.

FOUNDATION NOTES:

1. HEADWALL STRUCTURES ARE DESIGNED TO BE SUPPORTED ON A SHALLOW FOUNDATION WITH A MAXIMUM ALLOWABLE BEARING PRESSURE OF 3000 PSF.

2. WEIR CHAMBER STRUCTURES ARE DESIGNED TO BE FOUNDED ON A DEEP PILE FOUNDATION MEETING THE FOLLOWING REQUIREMENTS:
   - PILES SHALL BE TREATED TIMBER PILES CONFORMING TO ASTM D25, CLASS B FOR MARINE STRUCTURES.
   - PILES SHALL BE PROVIDED IN ACCORDANCE WITH NYCDEP BWSO-STANDARD SEWER AND WATER MAIN SPECIFICATION SECTION 70.11
   - PILES SHALL HAVE A MINIMUM TIP DIAMETER OF 12" AND SHALL HAVE A 6" MIN EMBEDMENT INTO FOUNDATION SLAB.
   - PILES SHALL BE INSTALLED AS REQUIRED TO DEVELOP A MINIMUM VERTICAL DOWNWARD ALLOWABLE LOAD OF 20 TONS AND A MINIMUM ALLOWABLE LATERAL LOAD OF 1 TON.
   - FOR INITIAL BID PURPOSES, ALL TIMBER SHALL HAVE A MINIMUM ASSUMED LENGTH OF 40 FT.

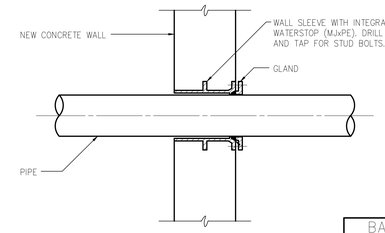
# 7	# 5
# 8	# 6
# 9	# 7
# 10	# 8
# 11	# 9
AT LOCATIONS WHERE DIFFERENT SIZE HORIZONTAL BARS CONVERGE, THE LARGER BAR SIZE SHALL CONTROL	



WALL SLEEVE DETAIL

NOTES:

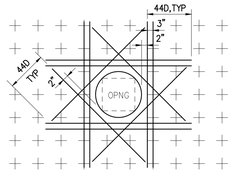
1 THIS DETAIL APPLIES FOR OPENINGS 8"ø AND LARGER. FOR SMALLER OPENINGS, BEND BARS OR ADJUST SPACING OF REINFORCEMENT TO AVOID OPENING.

2 PLACE EXTRA BARS OF THE SAME SIZE AS THE INTERRUPTED BARS AT EACH SIDE OF OPENING. QUANTITY OF EXTRA BARS AT EACH SIDE SHALL EQUAL HALF THE QUANTITY OF INTERRUPTED BARS EXCEPT WHERE NOTED OTHERWISE.

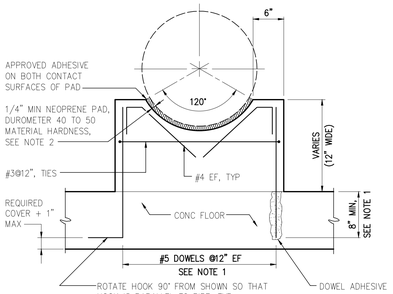
3 PROVIDE ONE DIAGONAL BAR EACH SIDE OF OPENING WITH SIZE EQUAL TO MAIN REINFORCEMENT, TYPICAL EACH FACE.

4 WHERE INVERT OF OPENING IN WALL IS LESS THAN 44 BAR DIAMETERS FROM TOP OF SLAB, EXTRA REINFORCEMENT ON EACH SIDE SHALL INCLUDE DOWELS EMBEDDED INTO SLAB WITH STANDARD 90 DEGREE HOOKS TO SPLICE WITH EXTRA VERTICAL REINFORCEMENT. DOWELS SHALL ALSO STILL BE PROVIDED BELOW OPENING.

5 WHERE INVERT OF OPENING IN WALL OR SLAB IS CLOSER THAN 44 BAR DIAMETERS TO EDGE OF SLAB OR BOTTOM OF WALL, EXTRA DIAGONAL BARS MAY BE TERMINATED TWO INCHES FROM EDGE OF SLAB OR BOTTOM OF WALL. DOWELS DO NOT HAVE TO BE PROVIDED TO SPLICE WITH DIAGONAL BARS.



TYPICAL REINF AT OPNGS DETAIL

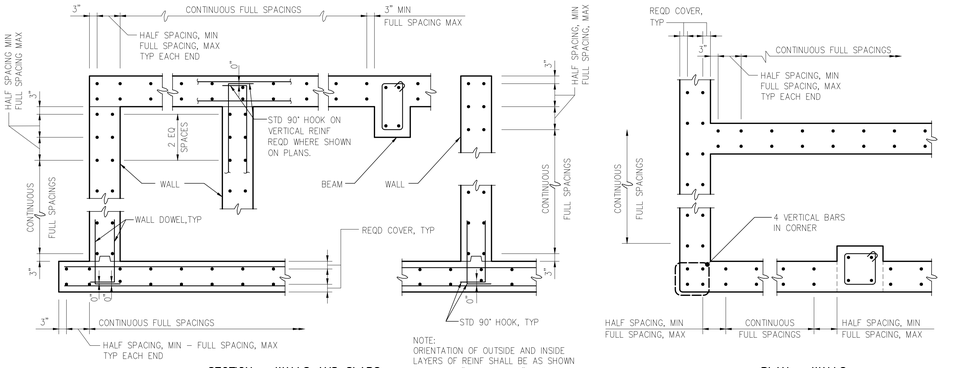


NOTES:
1. DOWELS MAY BE CAST IN WITH 90° HOOK OR ANCHORED WITH DOWEL ADHESIVE AT CONTRACTORS OPTION. WHERE FLOOR IS 8" THICK OR LESS, USE #4 DOWELS EMBEDDED TO WITHIN 2" OF BOTTOM OF FLOOR SLAB.
2. ENGINEER SHALL VERIFY THICKNESS OF PAD WILL ACCOMMODATE DESIGN MOVEMENT, PARTICULARLY FOR OUTSIDE AERIAL PIPE.

CRADLE PIPE SUPPORT DETAIL

NOTES:
BARS TO BE WELDED SHALL CONFORM TO ASTM A706. WELDING SHALL BE DONE BY CERTIFIED WELDERS IN CONFORMANCE WITH AWS D1.4. WELDING IS PERMITTED ONLY WHERE SHOWN ON PLANS OR OTHERWISE APPROVED BY THE ENGINEER.

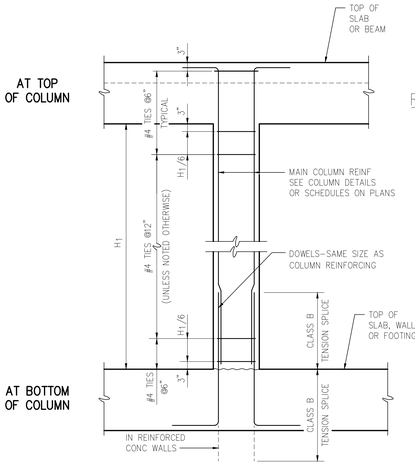
REINFORCING BAR WELDMENT DETAIL



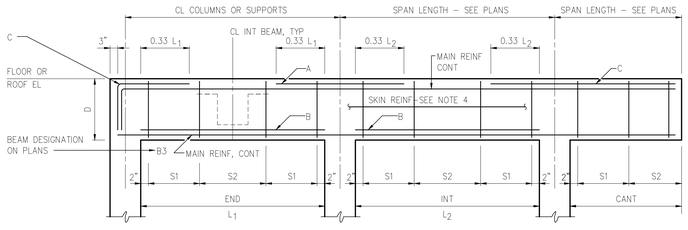
SECTION – WALLS AND SLABS

NOTE:
ORIENTATION OF OUTSIDE AND INSIDE LAYERS OF REINF SHALL BE AS SHOWN ON PLANS. "FULL SPACING" IS BAR SPACING CALLED OUT ON PLANS.

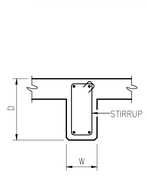
PLAN – WALLS



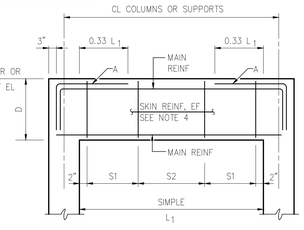
TYPICAL COLUMN ELEVATIONS DETAIL



TYPICAL BEAM REPLACEMENT DETAIL



TYPICAL BEAM SECTION



NOTES:

1 **WHERE BEAMS FRAME INTO CONCRETE WALLS, WALLS SHALL BE BLOCKED OUT FULL HEIGHT AND WIDTH OF BEAM TO PROVIDE A MINIMUM 8" SEAT FOR BEAM BEARING. WALL REINFORCEMENT SHALL NOT BE INTERRUPTED THROUGH BLOCKOUT.**

2 **S1 = 2x"D" FOR STIRRUP SPACING SEE BEAM SCHEDULE**

3 CONTINUOUS BOTTOM BARS IN ALL BEAMS MAY BE SPLICED AT COLUMN CENTERLINES. CONTINUOUS TOP BARS MAY BE SPLICED AT MID–SPAN.

4 UNLESS NOTED OTHERWISE, PROVIDE SKIN REINFORCEMENT BETWEEN TOP AND BOTTON MAIN REINFORCEMENT AS FOLLOWS:
FOR BEAMS 18" OR LESS IN DEPTH, NO SKIN REINFORCEMENT IS REQUIRED
FOR BEAMS >18" THRU 36" IN DEPTH, PROVIDE #5@12" EF
FOR BEAMS >36" THRU 84" IN DEPTH, PROVIDE #5@6 EF
FOR BEAMS >84" IN DEPTH, SEE REMARKS IN BEAM SCHEDULE.

5 ALL STIRRUPS SHALL BE CLOSED TIES, TYPE T1, (ACI 315) UNLESS NOTED OTHERWISE.

6 SEE DRAWINGS FOR BEAM ELEVATION DIAGRAMS SPECIFICALLY REFERRED TO IN THE BEAM SCHEDULES.

7 WHEN TWO LAYERS OF FLEXURAL REINFORCEMENT ARE REQUIRED THE SPACING BETWEEN THE LAYERS SHALL BE 3 INCHES.

EXPLANATION OF TERMS

SOIL SIZES

Description Term	Pass Sieve No.	Retained Sieve No.	Size Range
Clay Silt	200	(Note 1)	< 0.075 mm
Fine Sand (F)	40	200	0.075 to 0.420 mm
Medium Sand (M)	10	40	0.420 to 2.00 mm
Coarse Sand (C)	4	10	2.00 to 4.75 mm
Gravel (Note 2)	-----	-----	4.75 to 75 mm (3")
Cobbles	-----	-----	3" to 12"
Boulders	-----	-----	>12"

NOTES: 1. Atterberg limit can be conducted to classify fine grained soil to classify the sample in addition to field tests.
2. For visual identification, NYC Building Code does not distinguish between Fine and Coarse Gravel.

QUANTITATIVE ESTIMATE

Minor Components	Percentage Range
AND	35 - 50
SOME	20 - 35
LITTLE	10 - 20
TRACE	<10

FINE-GRAINED SOIL

Soil Type	Thread Dia.	Plasticity Index
SILT	None	Zero
CLAYEY SILT	1/4 inch thread	1 to 5
SILT & CLAY	1/8 inch thread	5 to 10
CLAY & SILT	1/16 inch thread	10 to 20
SILTY CLAY	1/32 inch thread	20 to 40
CLAY	1/64 inch thread	40 or more

UNIFIED SOIL CLASSIFICATION SYSTEM

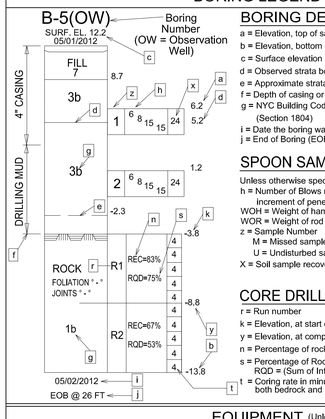
USCS	Typical Descriptions	USCS	Typical Descriptions
GW	Well-graded gravels, gravel - sand mixtures, less than 5% fines.	ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity
GP	Poorly-graded gravels, gravels - sand mixtures, less than 5% fines.	CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays.
GM	Silty gravels, gravel - sand - silt mixtures, more than 12% fines.	OL	Organic silts and organic silty clays of low plasticity
GC	Clayey gravels, gravel-sand-clay mixtures, more than 12% fines.	MH	Inorganic silt, micaceous or diatomaceous fine sandy or silty soils, elastic silts.
SW	Well-graded sands, gravelly sands, less than 5% fines.	CH	Inorganic clays of high plasticity. Fat clays.
SP	Poorly-graded sands, gravelly sands, less than 5% fines.	OH	Organic clays of medium to high plasticity, organic silts.
SM	Silty sands, sand - silt mixtures, more than 12% fines.	PT	Peat and other highly organic soils.
SC	Clayey sands, sand - clay mixtures, more than 12% fines.		

ROCK CLASSIFICATION

HARDNESS:	WEATHERING:
Extremely (Ext) Hard - Intact specimen can only be chipped, not broken, by repeated, heavy blows of a geological hammer	Fresh (Fr) - No visible sign of rock material weathering, perhaps slight discoloration on major discontinuity surfaces
Very (V) Hard - Cannot be scratched with a steel nail. Inact specimen breaks only by repeated, heavy blows with geological hammer	Slightly - Discoloration indicates weathering of rock material and discontinuity surfaces. All the rock material may be discolored by weathering and may be somewhat weaker externally than in its fresh condition
Hard - Intact hand-held specimen requires more than one hammer blow to break it. Can be faintly scratched by steel nail	
Moderately (Mod) Hard - Can't be peeled or scraped with knife. Can be distinctly scratched with a steel nail	Moderately (Mod) - Less than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discolored rock is present either as a continuous framework or as corestones
Moderately (Mod) Soft - Shallow indentations (0.04 to 0.12 in.) can be made by firm blows with point of geologic pick. Can be peeled with pocket knife with difficulty	Highly - More than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discolored rock is present either as a discontinuous framework or as corestones
Soft - Hand-held specimen crumbles under firm blows with point of geologic pick	
Very (V) Soft - Can be scratched with fingernail. Slight indentation produced by light blow of point of geologic pick. Requires power tools for excavation	Completely (Comp) - All rock material is decomposed and/or disintegrated to soil. The original mass structure is still largely intact
FRACTURE SPACING (Sp.):	
Extremely (Ext) Close: <3/4 inch	Moderate (Mod): 8 inches to 2 feet
Very (V) Close: 3/4 inch to 2-1/2 inches	Wide: 2 to 6 feet
Close: 2-1/2 to 8 inches	Very (V) Wide: 6 to 20 feet

GENERAL NOTES:
1. Soil analyzed with organic content greater than 12 percent is classified as organic soil (OL or OH). Soil with less than 12 percent is classified as "trace organics" and not classified as organic soil. Soil with 30 percent or more organic content is classified as Peat (PT).
2. When laboratory results are not available, the group symbols are assigned based on the DDC soil description by visual identification and field tests by the inspector.
3. All Borings unless otherwise noted are cleared for utilities using either hand auger or vacuum extraction method to 6 feet below ground surface. Strata elevations and soil classification indicated in the borings within this zone are inferred based on visual observations and field judgement by the field inspector.
4. If any of the f-m-c grain size is less than 10 percent by weight of the sample then the grain size is not included in the sample description. If any of the two grain sizes is less than 10 percent by weight but the summation of the two equals or greater than 10 percent, then report all sizes.
5. Joints: The average natural angle of observed rock fractures in that particular core run. Mechanical breaks from drilling equipment are not accounted in the joint angle.
6. Foliation: A general term for, the planar arrangement of textural or structural features in any rock, especially the planar structure that results from flattening of the constituent grains of a metamorphic rock.

BORING LEGEND



BORING DETAILS

a = Elevation, top of sample
b = Elevation, bottom of boring
c = Surface elevation and start date of the drilling
d = Observed strata boundary and elevation
e = Approximate strata boundary and elevation
f = Depth of casing or drilling mud
g = NYC Building Code Class of Materials (Section 1804)
i = Date the boring was terminated
j = End of Boring (EOB) depth

SPOON SAMPLES

Unless otherwise specified, sample spoon was driven 24 inches.
h = Number of Blows required to drive sample spoon for each 6-inch increment of penetration in accordance with ASTM D-1586
WOH = Weight of hammer
WOR = Weight of rod
z = Sample Number or :
M = Missed sample
U = Undisturbed sample
X = Soil sample recovered in the split spoon (inches)

CORE DRILLING

r = Run number
k = Elevation, at start of core drilling
y = Elevation, at completion of Run
n = Percentage of rock core recovered
s = Percentage of Rock Quality Designation (RQD)
RQD = (Sum of Intact and Sound Rock ≥ 4") / (Core Run Length)
t = Coring rate in minutes/foot for both bedrock and boulder

EQUIPMENT (Unless otherwise noted)

Type of spoon hammer	AUTO	Size of Split spoon	2.0 inches.
Weight of casing hammer	140 lbs.	Size of Core Bit	- inches.
Weight of spoon hammer	140 lbs.	Type of Core Barrel	-
Size of Casing	4.0 inches.		

DATUM NOTE: All Elevations refer to the Borough of QUEENS HIGHWAY Datum, which is 2.725 Feet above Mean Sea Level at Sandy Hook as established by the U.S. Coast & Geodetic Survey.

SUBSURFACE INVESTIGATION NOTES:
1. BORINGS B-1 THROUGH B-118 WERE PERFORMED BETWEEN OCTOBER 2013 AND JANUARY 2014.
2. BORINGS B-16 AND B-17 WERE CANCELLED DUE TO LACK OF WETLAND PERMITS DURING INITIAL WORK IN 2013.
3. BORING B-49 WAS CANCELLED AFTER ENCOUNTERING A HARD OBJECT AT 6' BELOW GROUND SURFACE AT ORIGINAL AND OFFSET LOCATIONS.
4. BORINGS B-1A THROUGH B-17A WERE CONDUCTED IN THE WETLANDS IN DECEMBER 2014 AS A SUPPLEMENTAL DRILLING PROGRAM ONCE WETLANDS PERMITS WERE OBTAINED.
5. STANDARD PENETRATION TESTS (SPTs) FOR BORINGS B-34, B-41, B-42, B-54 TO B-57, B-60, B-78 TO B-80, B-84, AND B-114 WERE PERFORMED USING A 140-LB SAFETY HAMMER.

IMPORTANT NOTES:

1. The Boring Logs shown on this sheet are the result of inferences drawn by the engineers or scientists during boring operations at the site, and from certain visual evidence such as: (a) samples of subsurface materials recovered during boring operations; (b) the logs kept by the drill operator and the inspector, which contain, among other things, expression of their opinions as to the nature of subsurface materials encountered during boring operations; and (c) other records concerning the site deemed pertinent by the engineers. The driller's log, the inspector's log, the samples and the records, together with the engineer's reports, are made available for inspection and study by the bidders so that they may draw their own inferences from all of the available evidence.
2. Bidders are warned that in the subsurface, other than that actually penetrated by the borings, obstructions, both natural and man-made, and which are not indicated on the Boring Logs, may be encountered, and that the Boring Logs make no representations or warranties either as to the presence or absence of such obstructions, or as to their nature and extent. Where possible, borings are located to avoid all obstructions and previous construction which can be found by inspection of the surface, and the bidder is required to estimate the influence of such features from his own inspection of the site.
3. In addition, bidders are warned that in the subsurface other than that actually penetrated by the borings, soil or rock may vary widely, with regard to elevation, composition, texture, structure, perviousness, soundness, and other characteristics, from the descriptions given on the Boring Logs and all reports.
4. The "groundwater reading", shows the elevation of groundwater in the boring holes at the times indicated. They may or may not indicate the elevations of perched water or true groundwater table during boring operations or subsequently thereafter.
5. The samples are described using the DDC Soil Description and Rock Classification, followed by Group Symbols from the Unified Soil Classification System and the 2008 NYC Building Code Class of Materials.
