- 4 Project Site Map showing location of features and soil borings

## EXECUTIVE SUMMARY

During October 1995 field testing at the Long Island College Hospital Parking Garage Site (CEQR No. 87-013K) in Brooklyn, New York, was undertaken.

The purpose of the testing program was to ascertain the presence/absence and nature of cultural resources on the project site. In order to facilitate the examination, a backhoe was used to remove the heavy debris that was present and expose any historic features within the area considered archaeologically sensitive as outlined in the Phase 1A Archaeological Assessment. Following the removal of 5-7 feet of overburden (fill), four features were discovered along with the remains of foundations of some mid-to late nineteenth-century buildings constructed along Atlantic Avenue and Hicks Street. Each of the features was carefully examined in order to determine if it was in any way associated with either of the two research periods previously identified for investigation:

- 1) Revolutionary War burials, and
- 2) the early nineteenth-century farmstead.

No material evidence of these usages of the site was recovered. Instead, it appears that remains of earlier activities were obliterated during the "brownstone" period of the mid-to late nineteenth century. Therefore, no further archaeological consideration of the site is warranted.

## INTRODUCTION

The Long Island College Hospital (LICH) has proposed construction of a nine-story parking garage within a portion of Van Voorhees Park (Block 283) in Brooklyn, New York (Fig. 1). The project site is located at the southwest intersection of Atlantic Avenue and Hicks Street, just east of the Brooklyn-Queens Expressway. The present report will address the Phase 1B archaeological examination of the proposed redevelopment project (CEQR #87-013K).

The New York City Landmarks Preservation Commission (LPC) requested that a Phase 1A Archaeological Sensitivity Assessment be conducted for the proposed parking garage site, hereafter called the project site, on Block 283 and old Block 289 of Ward 6 in Brooklyn (Fig. 2). The Phase 1A documentary assessment, conducted in 1989 by Historical Perspectives, Inc. (HPI), outlined changes in land-use through the prehistoric and historical periods, identified lots within the project site where there had been little known surface and subsurface disturbance, indicated which lots contained possible archaeological resources and recommended that further research was warranted prior to the construction of the parking garage. Out of the 21 lots that are located within the project site, portions of only six were identified as having the potential to contain cultural material relating to the above land-use phases (Lots 10, 11, 12, 13, 17, and 18) (Fig. 3).

The Archaeological Assessment of the site, approved by the New York City Landmarks Preservation Commission (LPC) in 1989, identified a portion of the proposed site as having the potential to contain archaeological resources associated with the Revolutionary War and a farmstead from the early Federal Period.

1) Nineteenth century descriptive histories record the use of the general area for sheds and huts that housed the sick as well as a burying ground for military personnel for some duration around the period of 1780. Evidence for the precise location or number of burials has not been found in written documents; subsurface testing endeavored to ascertain whether or not resources associated with this period were extant.

2) Archival sources reveal that the project site was part of a farm occupied and owned by the Patchen family, c. 1808-1829. Recovery of material remains from an early nineteenth century farmstead in the New York City area would make a significant contribution to the archaeological record.

The archaeological field examination of the site was conducted by HPI during October and November 1995. The excavation of the above lots identified in the Phase 1A report as archaeologically sensitive was carried out in order to establish the presence/absence

of cultural resources. The historic features discovered were explored and the cultural materials recovered were analyzed in order to determine the nature of the cultural resources on the project site.

## FIELD METHODOLOGY

In the Phase 1A Archaeological Assessment a section of the project site was identified as archaeologically sensitive (see Fig. 3). The project area is located near the western shore of Brooklyn. The site is on a hill gently rising toward the east away from the East River. The project area was identified as "a transitional zone between the glacial deposits that included till and lacustrine outwash, sand, silt, clay, and boulders on the east" and marshland to the west along the shore (HPI 1989: 4).

Prior to field testing, six soil borings were placed within the project site (7/20/95-7/21/95). Of these, three were directly within the area considered to be archaeologically sensitive (B4, B5, and B6) (Fig. 4). Table 1 presents a summary of the information retrieved from the soil borings. The borings demonstrated that there was from 6 to 12 feet of "historical fill" located within the project site, and in one location, a thick level or deposit of "ash."

Table 1. Long Island College Hospital Parking Garage Site Soil Borings.

	B1	B2	B3	B4	B5	B6
Historical Fill	6"-12'	1-7'	1-10'	1-9'	1-10'	1-6'
Ash deposit						6-15'
Glacial Till with Gravel	12-18'	7-11'	10-15'	8-13'		15'-
Coarse Sand, some Gravel	18-42'	11-30'	15-32'	13-42'	10-21'	
Fine Sand, some Gravel					21-37'	
End Depth	42'	30'	32'	42'	37'	15.5

As mentioned above, the primary objective of the Phase 1B testing was to ascertain the presence/absence and nature of the cultural resources on the project site. In order to achieve this goal a number of field procedures were undertaken at the site that are briefly described below: 1) the project site was completely fenced; 2) the archaeologically sensitive area was outlined and mapped (field investigations were restricted to those areas identified in the Phase 1A report); and, 3) the playground/park equipment and asphalt paving was removed with heavy machinery.

In order to facilitate the examination of the garage lot, a backhoe was used to remove the heavy debris that was present and

expose any historic features within the area considered archaeologically sensitive. Based upon the information from the soil borings taken within the archaeologically sensitive area (B4, B5, and B6) the depth of fill and/or historical cultural material extended to approximately fifteen feet below the surface. With this information the field archaeologists were able to direct the backhoe operator to remove only shallow increments of soil when nearing the lower fill levels.

Subsurface archaeological testing was then conducted using a combination of shovel shaving and hand excavation following the location of historical features. All of the features recovered were identified and tested in order to determine if further archaeological examination of the Long Island College Hospital parking garage site was needed. The soil was sifted through 1/4 inch screen and artifacts were collected in the field. All brick, mortar, unidentified nails (and other amorphous metal objects), and coal fragments were noted and discarded in the field.

The appropriate drawings and photographs were made of each of the features examined (See Field Drawings 1 - 6 and Photographs 1 - 5). Appendix A is an excavation record of each feature. A plan view map of the site, including elevations, was also completed (see Fig. 4). Foundations of the former buildings were located and used for measuring/alignment purposes. Cultural material was processed and boxed according to accepted standards. A catalogue of artifacts is located in Appendix B of this report. Those marked "pulled" refer to items delivered to the LICH for their display collection. (See discussion in Conclusions and Recommendations section of this report.) Appendix C contains summary tables of artifacts recovered from Features 1 and 3 sorted by group, class, and function.

## RESULTS OF INVESTIGATIONS

On Thursday October 19 field testing commenced. A crew of four archaeologists completed the fieldwork phase of the project over a period of 6 days. In order to facilitate the examination of the garage lot, a backhoe was used to remove the heavy debris that was present and expose any historic features within the area considered archaeologically sensitive (Lots 10, 11, 12, 13, 17, and 18) (see Figs. 2 and 3).

Following the removal of 5-7 feet of overburden (fill), four features were discovered along with the remains of foundations of nineteenth-century brick buildings (Fig. 4). The features were located within four of the six lots considered to have potential for the presence of historical material (Lots 11, 13, 17, and 18). Three of the historical features located and examined during the investigation of the site were associated with water management (Features 1, 3, and 4). The other feature was a portion of a decorative brick and tile floor (Feature 2). The three features associated with water management were large brick cisterns that were encountered in the location of the backlots affiliated with mid-nineteenth century brick buildings formerly located along Atlantic Avenue and Hicks Street. The floor was also found within the backlot of one of the brick buildings.

Throughout the site the bulk of the artifactual material was architectural in function (e.g., brick, nails, mortar, window glass, and miscellaneous iron fragments). These artifacts ranged in size from small brick spalls and nail fragments to whole bricks and in many cases portions of the brick walls belonging to the former dwellings. The recovery of these materials is consistent with sites where demolition activity took place.

What follows is a review of the four historical lots that contained below ground features.

### Lot 11 - Feature 2

In the Phase 1A report, most of the backyard of Lot 11 was considered to be potentially sensitive for the recovery of intact subsurface remains. Historical research indicated that the brick dwelling located on Lot 11 had a store located on the ground level. The review of historical maps showed that the rear yard remained empty of construction until c.1904 when a small addition was attached to the rear of the building (HPI 1989: Appendix B; Sanborn 1904).

One feature was discovered partially under a thick ash deposit in the northwest section of the site within Lot 11 (see Figs. 2 and 4). A portion of the ash deposit, which also contained late nineteenth -early twentieth-century artifacts, was excavated by hand

(Appendix A). A small tiled courtyard, walkway, or entry associated with the addition to the mid-nineteenth-century brick dwelling was found under the ash deposit (Field Drawing 1; Photograph 1). A section of tiles was removed and found to be supported by a single tier of bricks. The bricks were placed in a bed of clay which was found to be located directly above sterile soil.

The bedding, decorative brickwork, and narrow foundations indicate that this feature was not part of the foundation or interior of the three-story brick structure with cellar that was located on Lot 11. Instead, this feature may have been a decorative flooring for the addition or a portion of a walkway or courtyard adjacent to the rear of the structure. The Phase 1A report also noted that in 1904, when the addition was constructed, there were three families living in the brick dwelling (HPI 1989: Appendix B).

The ash deposit covering a portion of this feature was likely deposited during the filling of this locale following the demolition of the brick dwelling. The artifacts recovered from this deposit are consistent in age and type with artifacts observed and noted from the fill levels throughout the site (Appendix B). They include, an early twentieth century bullet casing, a large number of ceramic and bottle fragments, animal bone, shell, and a beer bottle cap dated Feb. 7 1893.

#### Lot 13 - Feature 1

The Phase 1A report concluded that Lot 13 had potential for the recovery of intact subsurface cultural material (HPI 1989: Appendix B). A three-story brick dwelling with a store at street level was located at this address. According to historical maps of the nineteenth and twentieth centuries, this structure had an open 20' x 20' backyard.

One of the cisterns recovered through excavation was located in the northeast portion of the site within Lot 13. This feature had been truncated prior to the demolition of the buildings, leaving only the bottom 3 feet of the cistern intact (Field Drawings 2 and 3; Photograph 2). The interior fill of the feature was bisected and each half of the fill was excavated by hand. The single brick, mortar-lined cistern was found to contain three distinct deposits dating from the late-nineteenth century (Appendix A).

Pipe holes near the base of the cistern indicate that this feature may have serviced several buildings, including those on located on Lots 12 and possibly 14. The structure on Lot 14 was a three-story building that had a bakery on the first floor as early as 1886 (Sanborn Fire Insurance Map). Subsequent Sanborn maps also indicate that the small addition attached to the rear of the building was the location of the bakery's oven (1904, 1915).

Historical research demonstrated that Lot 13 was part of a seven-lot parcel that was transferred at least ten times between 1829 and 1861. Henry Lindenberg was identified as purchasing the lot in 1867. Lindenberg and his family, however, lived in the dwelling in the adjacent Lot 12. Because the three holes for pipes were placed in different locations within the cistern, it was impossible to precisely identify with which structure this feature was most directly associated. The fact that these parcels were transferred as a whole through much of their history as commercial/ residential buildings may account for the multiple structures serviced by the cistern. It is likely, however, that most of the materials used to fill the feature came from the closest dwellings, the buildings on Lots 13 and 14.

Although no structures were identified on historical maps as being located within the rear lot, the removal of the upper portion of the cistern (which would have been underground) prior to the demolition of these brick buildings in the twentieth century (1939-42), indicates that some other yard activities may have occurred. The fact that no large portions of the feature were noted in the upper fill and the entire feature was covered by a thin layer of ash helped to confirm the supposition that the feature was truncated prior to the demolition of the buildings and filling of the lot.

#### Artifact Analysis

The interior fill of this feature was bisected and the eastern half removed first. Because of the shallow depth of fill the western half was also excavated by natural levels. While the matrix of the levels was slightly different, the artifactual material recovered was mixed throughout the levels allowing for some cross-mending. This implies a series of dumpings, likely from a furnace locale that was carried out over a very short period of time. Perhaps this occurred upon the introduction of public water to Atlantic Avenue in 1858. The analysis of artifacts recovered from this feature indicates that this deposit likely dates to the third quarter of the nineteenth century.

None of the artifacts denoted any specific occupation. Rather, the majority of the assemblage recovered related to domestic eating and drinking activities (Appendix C, Tables 3, 5, 7, 9, and 11). After window glass, the second largest class of material recovered was ceramics, which accounted for 19.8% of the assemblage (see Appendix C, Table 5). While most of the ceramic artifacts were nineteenth century whiteware, there were a few unique objects recovered (Appendix B, Table 2). They include; a German stoneware jug, a brown stoneware mineral water bottle, and a semi-porcelain salt dish in the shape of a fish. A large amount of the ceramic fragments recovered from this feature relate to food service and eating (see Table 11). In addition, there was a large number of ceramic fragments that were identified as parts of drinking vessels (almost all were from tea cups).

Out of the 263 bottle fragments recovered, 64 were positively identified as having functioned as medicinal bottles, and 52 were used for non-alcoholic beverages (see Appendix C, Table 9). The large number of assorted glass bottle fragments likely functioned as alcohol containers, although they could not be positively identified as such. The domestic nature of the assemblage was also confirmed by the number of personal objects recovered (e.g., pencils, shoe parts, buttons, pipe fragments, marble, doll parts, bed springs and an 1860 United States penny; see Appendix B, Table 2).

To conclude, the cistern was likely constructed prior to the introduction of public water in 1858, and was in turn probably filled with domestic trash not long after that date. The presence of the 1860 coin within the feature also indicates that the cistern could not have been filled before that date.

#### Lot 17 - Feature 3

Lot 17 was considered to have potential for the recovery of cultural material in the 30' x 60' backyard area of a three-story brick dwelling (HPI 1989: Appendix B). Like the structures found on lots 11 and 13, this building also had a store on the street level. Sometime after 1904 a small outbuilding was constructed in this rear lot (Sanborn 1904, 1915). However, no archaeological evidence of this structure was recovered. Instead, Feature 3, a cistern, was found. This double-brick cistern, more intact than Feature 1, was bisected and the fill on the east side removed following natural stratigraphic levels. The east side of the cistern was excavated by hand to a depth of c. seven feet (Field Drawings 4 and 5; Photograph 3 and 4). This feature was also truncated, although not as severely as the one located in Lot 13. Four distinct deposit levels containing late nineteenth - early twentieth century artifacts were identified within the second cistern (see Appendix A).

#### Artifact Analysis

The assemblage recovered from the eastern half of Feature 3 was similar to the materials recovered in Feature 1. This similarity is likely because both features were probably filled around the same date, following the introduction of public water to this area. As with Feature 1, the majority of the materials recovered relate to domestic eating and drinking activities (Appendix C, Tables 4, 6, 8, 10 and 12). Feature 3, however, had a much more considerable collection of food remains, including 429 bone fragments and 99 fruit pits (botanical) (Appendix C, Table 6). Bone (22.9%), ceramic (22.2%), and bottle (17.7%) fragments were found in the largest quantities followed by window glass (12.8%). Following assorted body fragments, the largest number of ceramics were related to eating (plates, bowls) health (washing pitchers) (see Appendix C,

Table 12). Unlike Feature 1, there was only a small number of drinking vessels (cups). One of the ceramic fragments recovered had a small maker's mark. This fragment was identified as from a plate made by Livesley Powell & Co., a company operating in Hanley, Staffordshire from c.1851-66. Another unique ceramic artifact was a large American stoneware crock (mendable) that was likely made in New York State.

Out of the 331 bottle fragments recovered, most were unidentified fragments, however, it is likely that they were alcohol-related (see Appendix C, Table 10). One glass ink bottle was also recovered. This whole bottle was the eight-sided umbrella type which was popular from c. 1820-1880. Fragments of a bitters bottle were recovered. Bitters bottles were favored during the third quarter of the nineteenth century when many Americans were concerned with health matters. Also, following the Internal Revenue Act of 1862, which placed a heavy tax on alcohol, many of these rectangular bottles actually contained alcohol "doctored" with herbs and bitters. As with Feature 1, the domestic nature of the assemblage was also confirmed by the many personal objects recovered (e.g., shoe parts, buttons, pipe fragments, pencils, marble, porcelain doll parts, comb fragments, and a small gold ring; see Appendix B, Table 2).

To conclude, this more complete double-brick cistern was likely constructed prior to the introduction of public water in 1858, and was also in turn, probably filled with domestic trash not long after that date. The presence of a 1851 "Goodyear" hard rubber button within the lowest level of the feature indicates that the cistern could not have been filled before that date (see Appendix B, Table 2).

#### Lot 18 - Feature 4

The back yard of a two-story brick dwelling with store on Lot 18 was considered to have the potential for the recovery of cultural material. During the mid-nineteenth century the rear yard of this lot was used as a work area for a junk dealer. The family owned and operated the junkyard in this locale from as early as 1867 to at least 1935. During this time period several small outbuildings and additions were constructed in the rear yard. Historical research indicated that interior toilets could be found in the additions, however no archaeological evidence of these was recovered (HPI 1989: Appendix B). The outbuilding located along the east boundary of the property, at the rear of the lot, showed up on maps c. 1886. In 1904 the function of the rear structure was listed as a locale for "bottle storage." By 1915 it was less specifically called a "storehouse."

In the rear portion of this lot a third cistern was uncovered. A backhoe trench was placed along the south exterior wall of the

double-brick cistern. This truncated feature, was found to be approximately 5 feet deep (Field Drawing 6; Photograph 5). A portion of the south wall was removed and a sample column was excavated by hand within the feature. Unlike the first two cisterns, this feature contained only one discreet deposit of fill with few historical artifacts. This cistern was also not filled with the dry loose sand and ash found in Features 1 and 3. Instead the soil was identified as a medium brown sand. The exterior of this cistern was examined carefully for information about cistern construction techniques. A large circular hole was excavated and the lower c. four feet of bricks were likely placed directly against the soil, giving the interior a smooth surface and the exterior an uneven appearance. The upper courses of brick were placed more evenly and both the exterior and interior were more completely finished. The interior of the cistern, including the floor, was then coated with mortar. The cistern was then likely covered. The small number of artifacts recovered were similar in date and type to those found in Features 1 and 3 (see Appendix B, Table 2). Because of the limited number of artifacts recovered from within this feature a detailed analysis was not undertaken.

## CONCLUSIONS AND RECOMMENDATIONS

Although there was potential for the survival of material dating to the first two phases of land-use at the Long Island College Hospital parking garage site, only the remains of features dating to the commercial/residential phase of the site were found to be present. It is likely that the construction of the large brick dwellings sometime between 1833 and 1840 disturbed any cultural remains from the earlier occupations of the site during the Revolutionary War and Federal periods.

The three water management features that were recovered were likely introduced to the site before 1858, perhaps even when the brick dwellings were constructed. Their construction in the open yard areas would also have disturbed any features from the earlier occupation of the site. These shaft features became obsolete after the introduction of public water along Atlantic Avenue, and were then filled with domestic trash. The presence of dated objects (e.g., coin, button) confirms that these features were filled sometime after 1860 (Feature 1) and 1851 (Feature 3). Feature 2, the possible courtyard or floor, was also directly related to the brick dwelling built on Lot 11 during the commercial/residential phase of land-use at this site.

No other features were recovered. Therefore, no further archaeological consideration is necessary for the Long Island College Hospital parking garage site.

Although the artifacts recovered from the site do not relate to the historical periods that were the focus of the archaeological investigation, they have some intrinsic interest, especially from a community point of view. They reflect the lifeways of people - who lived just across the street from where the Long Island College Hospital now stands - approximately a hundred years ago. Therefore, a selection of artifacts from the entire assemblage was made and a separate catalogue generated for this group of objects (labeled "pulled" in Appendix B, the artifact catalogue). The LICH plans to use this collection for study and display.
