**MANAGEMENT SUMMARY
(05PR02121)**

Involved State and Federal Agency: New York City School Construction Authority

Phase of Survey: IB

Location Information

Location: Block 4102, Lot 27 (Jamaica Avenue at Richmond Street)
Minor Civil Division: Cypress Hills, Brooklyn
County: Kings

Survey Area

Length: 40-feet
Width: 50-feet
Depth: maximum of 7.5-feet
Number of Acres Surveyed: 0.02
Number of Square Meters & Feet Excavated (Phase II, Phase III only): 96.4 m² / 1,038 ft²
Percentage of the Site Excavated (Phase II, Phase III only): 41.8%

USGS 7.5 Minute Quadrangle Map: Brooklyn, NY and Jamaica, NY, 1979

Archaeological Survey Overview

Number & Interval of Shovel Tests: N/A
Number & Size of Units: N/A
Width of Plowed Strips: N/A
Surface Survey Transect Interval: N/A

Results of Archaeological Survey

Number & name of prehistoric sites identified: 0
Number & name of historic sites identified: 1 – Jamaica Avenue School Site
Number & name of sites recommended for Phase II/Avoidance: N/A

Results of Architectural Survey

Number of buildings/structures/cemeteries within project area: N/A
Number of buildings/structures/cemeteries adjacent to project area: N/A
Number of previously determined NR listed or eligible buildings/structures/cemeteries/ districts: N/A
Number of identified eligible buildings/structures/cemeteries/districts: N/A

Report Author(s): Kristofer M. Beadenkopf, RPA
Zachary J. Davis, RPA

Date of Report: November 2006

EXECUTIVE SUMMARY

In advance of the proposed new school construction, and on behalf of the New York City School Construction Authority (SCA), The Louis Berger Group, Inc. (Berger) has conducted a Phase IB archaeological survey as required under the *New York State Historic Preservation Act of 1980*, Section 14.09, the *State Environmental Quality Review Act* (SEQRA), and 6NYCRR Part 617 of the *New York State Environmental Conservation Law*. This Phase IB Archaeological Survey was designed to determine the presence or absence of archaeological resources within one historic lot, (Block 4102, Lot 27) located at the southwestern corner of Jamaica Avenue and Richmond Street in Cypress Hills, Brooklyn, New York. A Phase IA Archaeological Assessment conducted by Berger in April 2005 determined that Lot 27 possessed the potential to yield artifact/information rich subsurface features such as privies, wells, or cisterns dating to the period before 1885, when the project area was tied into city municipal water and sewerage services.

Archaeological fieldwork commenced on September 12, 2006 with the mechanical removal of 3.0-feet of asphalt and overburden fill-soils within Trench 1, which was located at the southern end of Lot 27. In the center of the trench and at a depth of 3.0-feet, the top of a large (7.0-foot square) privy shaft feature (Feature 1) was exposed and the mechanical excavations were halted to permit the systematic documentation and manual excavation of that feature. No additional archaeological features were discovered within Trench 1.

Following consultation with Douglas Mackey of the New York State Office of Parks Recreation and Historic Preservation (NYSOPRHP) regarding the documentation of Feature 1 and the methods of further excavation and Phase II evaluation of Feature 1, an additional trench (Trench 2) was mechanically excavated perpendicular to Trench 1, also to a depth of 3.0-feet, to investigate the potential for additional archaeological features and deposits within the central portion of the lot. Fourteen additional features, including 6 postholes, one trash pit, 3 planting holes, 4 root stains, and the rear foundation wall of a circa 1930s automobile repair shop were identified within Trench 2. The mechanical excavation of Trench 2 was halted to allow the documentation and manual excavation of these archaeological features. Following the documentation and manual excavation of the archaeological features within Trench 2 the mechanical excavation of soils within Trench 2 resumed to a depth of 7.5-feet to determine the presence or absence of additional buried archaeological deposits with the trench. No additional archaeological resources were discovered beyond 3.0-feet in depth and glacial till consisting of gravels and cobbles was noted within a sandy matrix at a depth of 6.0-feet below the ground surface. These glacial gravels were mechanically excavated to a depth of 7.5-feet below the ground surface.

A total of fifteen historic features were encountered at a depth of 3.0-feet below the ground surface within the excavated portion of Lot 27. Of these fifteen features, only Feature 1 contained deposits that could be assigned to a specific temporal period(s). The deposits within Feature 1 were contained within a 13.6-foot deep, wood-lined, square privy shaft located at the back of a mid-nineteenth century residence that had been demolished circa 1930.

Sixteen arbitrary levels, measuring between 0.5 and 1.0 feet in thickness, were excavated within Feature 1 and contained a variety of archaeological material, including earthenware, stoneware, tobacco pipe fragments, window and bottle glass, nails, faunal material, personal items, and locally produced products. Analysis of the artifacts recovered from within Feature 1, however, revealed a *terminus post quem* of circa 1930 for those deposits. As Feature 1 contained a large number of turn of the twentieth century artifacts that cross mended over many layers, it is likely that the entire contents of Feature 1 represent the byproduct of a single depositional episode. The deposition of artifacts and debris within Feature 1 corresponds closely with the demolition of the residence circa 1930 and is likely related to the removal and deposition of a portion of the contents of the residence into the open privy shaft prior to the demolition of the house. Although some mid-nineteenth century artifacts were recovered from Feature 1, such as tobacco pipe stem fragments, the overall lack of distinctly intact earlier mid-nineteenth century deposits within Feature 1 is likely due to the fact that the privy shaft had been cleaned of its contents immediately prior to the installation of municipal sewerage in 1885.

The archaeological investigations of this archaeological site, termed the Jamaica Avenue School Site, have identified the extent of the historic property and excavated all of the trash pit, postholes, and planting holes within

Trench 2, as well as the northwestern third of the privy shaft feature (Feature 1). This archaeological survey indicates that none of the archaeological deposits contained within the Jamaica Avenue School Site contain evidence of cultural behavior that can be directly associated with the mid-nineteenth century residents of historic Lot 27. As such, the site is recommended as not eligible for listing on the National or New York State Registers of Historic Places (NRHP/NYSRHP) as these deposits will not significantly add to our knowledge of the historic behaviors of the historic occupants of historic Lot 27. As a result, the proposed construction will not have an adverse effect on any NRHP/NYSRHP listed or eligible resources. Therefore, it is recommended that no further archaeological work is required within Block 4102, Lot 27 or the remainder of the archaeological APE associated with the proposed Jamaica Avenue School, to be located at the southwestern corner of Jamaica Avenue and Richmond Street in Cypress Hills, Brooklyn, New York.

1.0 INTRODUCTION

1.1 Project Description and Background

The New York City School Construction Authority (SCA) is proposing to construct a new school at a site located at Jamaica Avenue between Richmond and Logan streets (Figure 1). The site is bounded by Jamaica Avenue to the north, Richmond Street to the east, Etna Street to the south and Logan Street to the west. The Jackie Robinson Parkway is located approximately 0.4-mile to the north of the site. A cluster of cemeteries is located opposite the site along the north side of Jamaica Avenue.

The project site comprises a total of five lots: Block 4102, Lots 19, 27, 33, 35 and 36. This archaeological assessment will evaluate the archaeological potential of the five lots, forming the project's Area of Potential Effect (APE; Figure 2). Currently, there are a total of five structures located on the five lots: Lot 19, containing a fire-damaged machine shop and a second machine shop occupied by an ambulance company; Lot 33, containing a residence with a garage extension; Lot 35, containing a one-story structure used as a garage; and Lot 36, containing a residence.

A Phase IA Archaeological Assessment of the proposed location of the new school (Brooklyn Block 4102, Lots 19, 27, 33, 35 & 36) conducted by the Louis Berger Group, Inc. (Berger) in April 2005 identified one portion of the proposed project's Area of Potential Effect (APE) with the potential to contain historic archaeological resources (Berger 2005) (Figure 2). That archaeological assessment determined that the rear portion of Block 4102, Lot 27 possessed the potential to contain historic archaeological resources associated with the 19th century occupation of this lot that would be impacted by the proposed construction. Lot 27 is the location of the earliest building in Block 4102, having been constructed between 1859 and 1866. The presence of a house on Lot 27 at that time predates the introduction of municipal and water systems by over twenty years, thus it was presumed that the residence had several exterior subsurface shaft features such as a privy, well or cistern to accommodate these needs. Soil borings excavated within Lot 27 indicated that the rear portion of the lot possessed a moderate to high potential to contain intact archaeological resources at this rear of Lot 27 as soil borings in that portion of Lot 27 did not demonstrate evidence of substantial disturbance. As a result, Berger proposed to conduct the necessary Phase IB archaeological field testing within this portion of Lot 27 for the SCA in order to satisfy the requirements of the *New York State Historic Preservation Act of 1980*, Section 14.09 as required under the *State Environmental Quality Review Act (SEQRA)*, 6NYCRR Part 617 of the *New York State Environmental Conservation Law*. Appendix A contains all correspondence with the New York State Office of Parks, Recreation and Historic Preservation (NYSOPRHP).

1.2 Scope of Work and Project Personnel

This Phase IB report details the methods, results, and evaluations of archaeological deposits discovered during Phase IB fieldwork within Block 4102, Lot 27. This Phase IB archaeological survey involved the excavation of two mechanically excavated trenches and the documentation and manual excavation of archaeological features within the rear and central portions of Lot 27 as well as additional historic research regarding the occupants of this lot. This work has been conducted in accordance with the instructions and intent of the *New York State Historic Preservation Act of 1980*, Section 14.09 as required under the *State Environmental Quality Review Act (SEQRA)*, 6NYCRR Part 617 of the New York State Environmental Conservation Law. All research and reporting follows the standards established by the *Cultural Resource Standards Handbook* prepared by the New York Archaeological Council Standards Committee, the *Guidelines for Archaeological Work in New York City* prepared by The City of New York Landmarks Preservation Commission (LPC) and the *Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation* (Federal Register, 1983, Volume 18, Number 1990, pp. 44716-44742). All archaeologists overseeing the archaeological field work were certified with the Register of Professional Archaeologists (RPA) and meet or exceed the standards set forth in the Secretary of the Interior's Professional Qualifications Standards (36 CFR 61 and Federal Register 48:44738-44739). Mr. Zachary Davis, an RPA-certified (Register of Professional Archaeologists) archaeologist, served as Principal Investigator for this project. The archaeological survey was overseen by Mr. Kristofer M. Beadenkopf, RPA. Additional lot-specific deed research was conducted by Ms. Suzanne M. Mazziotta. The report was written by Mr. Beadenkopf and Mr. Davis. Mr. Davis and also assembled the report's graphics.

2.0 HISTORIC OVERVIEW of LOT 27

Additional historic deed research of Block 4102, Lot 27 (714 Jamaica Avenue) was conducted as part of this Phase IB archaeological survey in order to augment the historic background research that was presented as part of the Phase IA Archaeological Resource Assessment for the project performed by Berger in April 2005 and in attempt to determine an association between the lot's occupants and any archaeological deposits documented within the lot. This deed research was performed at the City Registers Office, in Brooklyn, New York and included all ownership information pertaining to Lot 27 from 1840 through the present. Although ownership of the lot can be tracked to the seventeenth century, as illustrated in Berger's Phase IA Archaeological Resource Assessment of the project, the decision to trace the ownership of Lot 27 from the present to 1840 was informed by an understanding that the lot was not actually occupied prior to 1840. In fact, there is strong evidence, in the form of historic cartographic data, that Lot 27 remained unimproved until sometime between 1859 and 1866 (Berger 2005:36). Also, as the historic occupation of the lot occurred from the mid-nineteenth century through the mid-twentieth century only the transfer of ownership from the 1840s through the 1950s is reported herein. A complete chain of title for Block 4102, Lot 27 is presented, however, in Appendix B.

Several, well-detailed maps provided invaluable data as to the developmental history of Lot 27. These maps were presented in the Phase IA Archaeological Resource Assessment for the project performed by Berger in 2005 and many of these maps are used to illustrate the relationships between the archaeological deposits documented by this Phase IB archaeological survey and the buildings that once existed on Lot 27 (Figures 3 through 9). The discussion of the historic cartographic resources that follows is meant to familiarize the reader to the development history of Lot 27 in the absence of the previous Phase IA report and to develop a historical context in which the Phase IB supplemental deed research can be interpreted.

The first documentation of a building within Lot 27 appears on the 1866 U.S. Coastal Survey map which shows a single building on Lot 27 fronting Jamaica Avenue. The 1873 Beers map shows that building, along with either a single building, or two attached buildings at the rear lot line on the adjacent Lot 33. It is unclear if these structures represent an outbuilding(s) associated with the earlier building on Lot 27, or a separate dwelling that fronted Richmond Street. The 1886 Robinson atlas and the 1887 Sanborn map of the lot indicate that a second one-story dwelling was constructed on Lot 27 along the western lot line fronting Jamaica Avenue and a one-story outbuilding, possibly a stable, located to the southwest corner of the building that appeared on the 1873 map. Maps from 1887 through 1905 show no changes to Lot 27, with the exception of the removal of the aforementioned stable sometime prior to 1893. By 1908, the building that was located along the western lot line of Lot 27 had been removed, possibly as a consequence of the growing Bates Machine Company complex situated on the adjoining Lot 19, or possibly as a result of some catastrophic event, such as a fire. The 1928 Sanborn Insurance Map shows the first building still in place; however, this same map (updated in 1950) shows that residence had been demolished and an automobile repair shop is shown located in the center of Lot 27. This auto repair shop was demolished around 1980 and the entire lot was converted to an asphalt parking lot (Berger 2005:36).

Prior to the development of Lot 27, which may have occurred between 1859 and 1866, the property was bought and sold by several individuals. Beginning in 1840, the supplemental deed research indicates that what is currently Lot 27 was sold by James and Henrietta Farless to Abraham H. Van Wyck (Liber 91, Page 230). Eleven years later, in 1851, Van Wyck deeded the property to Abraham S. Eldert (Liber 248, Page 132). On October 4, 1865 Abraham T. and Elizabeth S. Eldert, presumably the son and daughter/daughter-in-law of Abraham S. Eldert, sold Lot 27 to John V.W. Simonson (Liber 678, Page 166).

A deed from January 9, 1867 indicates that a John V.W. Simonson transferred ownership of Lot 27 to J. Cornelius Hendrickson (Liber 737, Page 247) who one day later, on January 10, 1867, transferred the lot to Margaret Simonson. (Liber 737, Page 335). The quick transfer of sale of Lot 27 from the Simonson family to Hendrickson and then immediately back to Margaret Simonson the day after may have been an attempt to avoid or defer the payment of taxes. Lot 27 remained in the ownership of Margaret Simonson until 1925, when ownership of the lot was transferred by John V.W. Simonson, executor of Margaret's estate, to Grace Doyle (Liber 4510, Page 279).

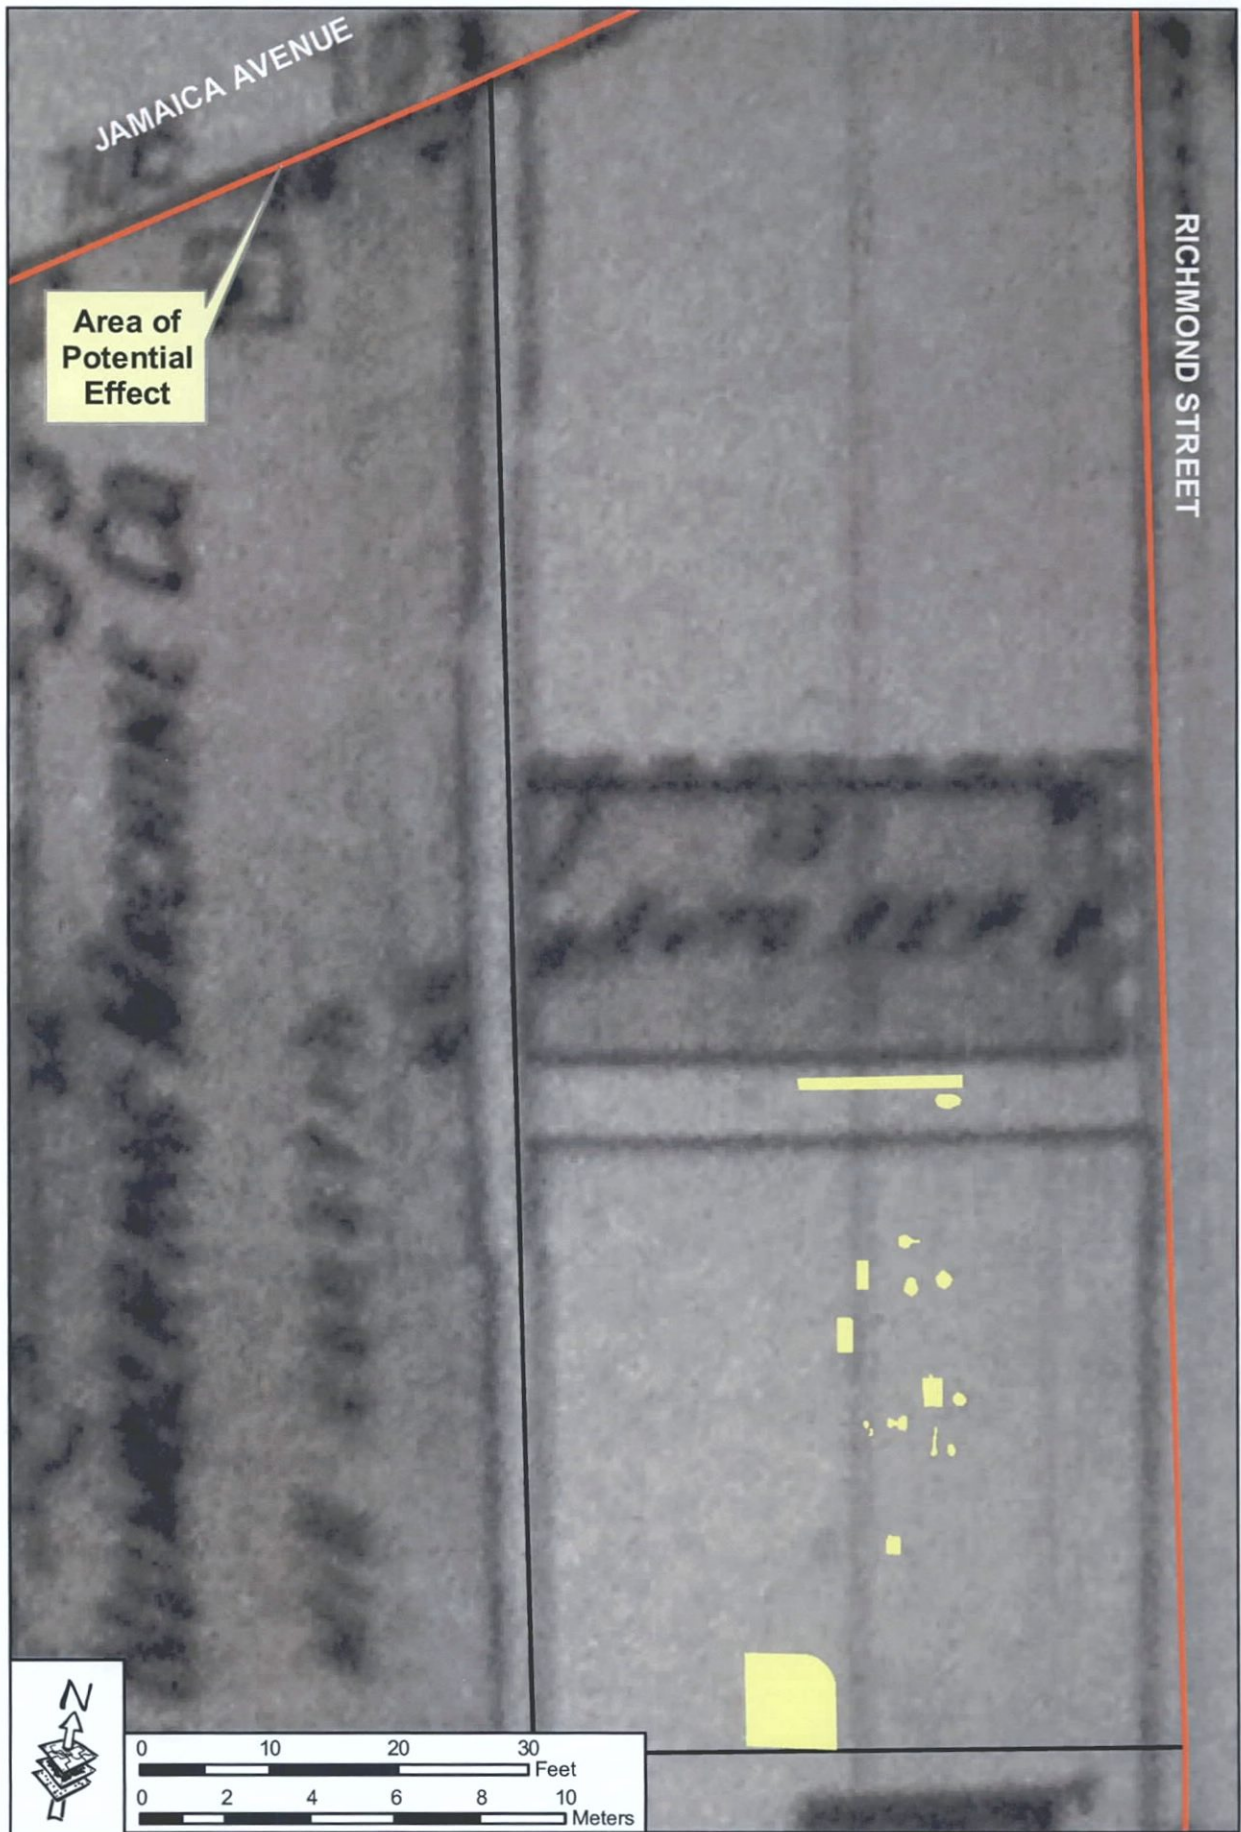

FIGURE 9: Archaeological Features Shown on 1950 Map

SOURCE: Berger Field Data 2006;
Sanborn 1950

The appearance of the residence on the 1928 Sanborn map and its disappearance by 1950 as shown on the 1950 Sanborn map, corresponds to the change in ownership and function of the lot, as indicated in the deeds dating from 1927 to 1957. Grace Doyle sold Lot 27 in 1927 to James, Joseph, and Malvina Raffaele (Liber 4836, Page 73). It is presumed that the Raffaele family demolished the residence on Lot 27 and operated a service station on the lot as a lease dated January 9, 1934 indicates that the Borough Park Service Station Inc. (James and Joseph Raffaele) leased Lot 27 to the Shell Easter Petrol Products Inc. James, Joseph, and Malvina Raffaele sold Lot 27 in 1955 to JFJ Stations Inc. (Liber 8329, Page 415), who then sold the property to the Sinclair Refining Company in 1957 (Liber 8537, Page 553).

Additional research of census records and city directories was conducted for the members of the Simonson family, as that family owned Lot 27 for 60 years, from 1865 to 1925. The 1873 Boyd's Brooklyn City Directory and the 1878 Lains' Brooklyn City Directory do not list any Simonsons living along Jamaica Avenue or (formerly known as Rappelje Street). John W. Simonson, a carpenter, appears in Lains' 1879 Brooklyn City Directory but his residence is listed at 135 High Street and not Jamaica Avenue. According to the 1880 United States Census, John V.W. Simonson was a 64 year-old, New York born, carpenter who lived on Rappelje Street with his wife Margaret, and three children; Mirriam (aged 19), John (aged 14), and Jetta (aged 10).

This information from the 1880 census was used to guide a search for additional information about the Simonson family. The 1897 Lains' Brooklyn City Directory indicates that John W. Simonson was deceased by 1897 and survived by his wife, Margaret, who is listed as "Margeretta" in the directory, who lived at 11 Richmond Street. That address is immediately opposite Lot 27 on the eastern side of Richmond Street.

The inclusion of the "V." in John W. Simonson's name in the 1880 census and/or the omission of the "V." in John W. Simonson's name in the 1879 and 1897 city directories, may be a source of confusion but it is likely that the elder John, who was a carpenter, and who was born in 1816, was the one who purchased Lot 27 in 1865 and then sold the lot to Hendrickson in 1867, who in turn deeded the property to Margaret Simonson, the wife of the elder John Simonson. As the elder John Simonson was deceased by 1897 and would have been 109 years old when Lot 27 was sold to Grace Doyle in 1925, it is apparent that the John V.W. Simonson, executor of Margaret's estate, was the son of the elder John and Margaret Simonson. This notion is supported by the fact that the younger John's sister Jetta was also named as heirs of Margaret's estate in the deed dated 1925 (Liber 4510, Page 279).

It is apparent that although the Simonson family owned Lot 27 from 1865 through 1925 there is no indication that the Simonson family ever lived in the house on Lot 27. The Simonsons most likely they rented the home on the property to several individuals through time as the 1897 city directory lists 714 Jamaica Avenue, the physical address of Lot 27, as the residence of William H. Cook, a sign-maker, and a clerk named Frederick Bettening. It is that 1897 city directory that indicates that the widow Simonson lived across the street from Cook and Bettening, at 11 Richmond Street. Neither of these individuals is listed as living at 714 Jamaica Avenue in any other previous or subsequent city directories suggesting that the residence on Lot 27 was occupied by a variety of tenants throughout the 60 years in which the Simonson family owned the property.

3.0 METHODS

3.1 Archaeological Field Methods

Archaeological field investigations were conducted between September 12 and September 22, 2006. Using the archaeological probability model developed for this project, which indicated that the southern portion of Lot 27 had not undergone much construction or demolition disturbance in the past, the archaeological work effort consisted of excavation of two mechanically excavated backhoe trenches within the archaeological area of potential effect (APE) (Figure 10). Each of these trenches was mechanically excavated in 1.0-foot deep increments to carefully expose visible cultural features.

Trench 1 measured 10 feet north-south and 50-feet west-east and was positioned west-east at the extreme rear of Lot 27 to determine the presence or absence of the location of a historic privy or other features likely located within the rear of the lot. Trench 1 was also extended 2.5-feet to the south and 11-feet long to expose the southern limits of a large shaft feature (Feature 1). Trench 2 measured 12.7-feet west-east and 40-feet north-south and was positioned north-south in the center of the lot extending from the center of the northern edge of Trench 1 to determine the presence or absence of additional cultural features within the central portion of the lot. Each of these trenches was mechanically excavated to between 3.0 and 3.5-feet below the current ground surface to reveal the natural subsoil and any/all cultural features within.

A total of twelve (12) cultural features and three (3) root stain features were documented within the natural subsoil at 3.0-feet below the current ground surface, including one feature discovered in Trench 1 and fourteen features discovered within Trench 2. The three "non-cultural" tree root stain features and brick wall feature, all of which were discovered in Trench 2, were excluded from archaeological excavation.

Following the initial discovery of the features, each feature was assigned a number designation and then illustrated on a scaled map of the trenches located within the archaeological APE; all measurements were recorded using tape and compass mapping techniques. Additional information regarding the soil texture and color, based on Munsell soil color charts, of each feature and the surrounding subsoil matrix was also indicated on this base map. Scaled plan view photographs were taken of all features prior to excavation and scaled plan view and profile photographs were also taken, as appropriate, to document the features during and after excavation.

With the exception of Feature 1, a privy shaft feature, the methods of excavation and documentation of which are described separately below, and Feature 15, a brick and cement wall, each cultural feature was bisected and half of the feature fill was removed as one provenience to reveal a profile of the feature.

Following appropriate documentation of each feature, using standardized feature forms developed by Berger, scaled drawings and photographs, the remaining portion of each cultural feature was excavated. All soils recovered from each feature were screened through 0.25-inch hardware mesh for systematic artifact recovery. When artifacts were recovered, they were bagged according to feature number provenience. Small quantities of ash, coal, and cinder were either sampled or discarded in the field, but in either case, they were noted in the field records.

The excavation and documentation of Feature 1 followed the general methods described above but due to the size of the feature, both horizontally and vertically, and largely homogeneous fill soils/ash/cinder it was deemed necessary to excavate and document Feature 1 in 0.5-foot arbitrary levels, unless an observable distinction in soils was encountered. Such a method of excavation and recordation of deep shaft features is a common practice and provides an opportunity to maintain vertical and temporal control of artifact deposits within an otherwise non-stratified homogeneous matrix (Wheeler 2000). One-third of Feature 1 (the northwestern 1/3) was removed systematically in 0.5-foot increments to a depth of 9.8-feet below the ground surface (Levels 1 through 12) and in 1.0-foot increments from 9.8-feet to 12.8-feet below the ground surface (Levels 13 through 15). The increase in the thickness of the arbitrary levels was based on field observations regarding the similarity of artifacts and their temporal range found throughout the feature. It was decided in the field that if the number of mid-nineteenth century artifacts increased at any time that further excavations would resume at 0.5-foot increments.

FIGURE 10: Location of Archaeological Trenches Excavated for the Phase IB Archaeological Survey

SOURCE: Berger Field Data 2006; NYCEMap GIS

At the base of Level 15 (12.8-feet below the current ground surface) it was decided that continued excavation of the entire contents of this northwestern 1/3 of Feature 1 would create an unsafe excavation environment. Results of a split spoon auger test at this depth revealed that the feature fill continued an additional 1.5-feet. Due to the safety concerns related to the complete excavation of this portion of the feature at this depth, a shovel test (1.5 feet in diameter) was excavated in the center of this portion of Feature 1. That shovel test, Level 16, revealed that Feature 1 extended to 13.6-feet below the current ground surface. An additional 0.4-feet as well as a split spoon auger test that extended to 16.0-feet below the ground surface was excavated in the shovel test pit to confirm that Feature 1 did not continue and that natural subsoil had been reached.

Due to the great depth of Feature 1, which extended to 13.6-feet below the ground surface, it was necessary to employ necessary OSHA appropriate soil set backs as well as the installation of a trench box to ensure the safety of the archaeologists (following 29 CFR 1926. Subpart P). To accomplish set backs the non-feature soils within Trench 1 as well as the eastern half of Feature 1 were mechanically removed to a depth of 8.5-feet below the ground surface. The mechanical excavation of the eastern half of Feature 1 was approved by NYSOPRHP and a representative sample of the artifacts from this portion of the feature was retained from the back dirt pile. Once a depth of 8.5-feet below the current ground surface was reached a 16' x 8' trench box was installed in conjunction with additional soil set backs to ensure the safe removal of the entire northwestern 1/3 of Feature 1.

Mechanical excavation within Trench 2 continued in 1.0-foot increments to a depth of 7.5-feet below the current ground surface to determine the presence or absence of additional cultural features and to obtain a vertical soil profile of the soils down to that depth subsequent to the systematic documentation and excavation of all features discovered within Trench 2. No additional features were discovered beyond 3.0 to 3.5-feet below the ground surface, rather, sand was noted at 5.0-feet and sand with medium sized cobbles (glacial till) was encountered at 6.0-feet below the ground surface.

3.2 Laboratory Methods

3.2.1 Laboratory Processing

All artifacts were transported from the field to Berger's laboratory. In the field, artifacts were bagged in 4-mil, resealable polyethylene bags. Artifact cards bearing provenience information were included in the plastic bags. A Field Number was assigned to each unique provenience in the field. This number appears with all the provenience information and is used throughout processing and analysis to track artifacts. The entire artifact inventory for all artifacts recovered is provided in Appendix C.

In the laboratory, provenience information on each artifact card was checked against a master list of Field Numbers with their proveniences. Any discrepancies were corrected at this time and a Catalog Number was assigned to each provenience, according to New York State Museum guidelines.

Most historic artifacts were washed in water with a soft toothbrush. Faunal material, and fragile artifacts were wet-brushed with a soft natural-bristle paint brush or were simply dry-brushed. Metal objects were cleaned using a dry toothbrush or stainless steel wire brush. All artifacts were laid out to air-dry in preparation for analysis.

During analysis, individual Specimen Numbers were assigned to artifacts within each Catalog Number for each analytical Class: historic ceramics, curved (vessel) glass, small finds/architectural, historic tobacco pipes, and faunal.

After analysis, the artifacts were re-bagged into clean, perforated 4-mil resealable polyethylene bags. Artifacts are organized sequentially first by Site Number, then by Catalog Number, and finally by artifact Class and Specimen Number within each Catalog Number. An acid-free artifact card listing full provenience information and analytical class was included in each bag.

3.2.2 Analytical Methods

All artifact analyses were conducted by the Laboratory Supervisor and/or Material Specialist(s). Berger maintains an extensive comparative collection and laboratory research library to contribute to the completeness and accuracy of the analyses.

Berger has developed a flexible analytical database system that fully integrates all artifacts in one database for use in data manipulation and interpretation. The computerized data management system is written using Paradox® 9, a relational database development package that runs on a Windows® platform.

Each class of artifacts (historic ceramics, curved (vessel) glass, small finds/architectural, historic tobacco pipes, and faunal) has a series of attributes, sometimes unique to that class, that are recorded to describe each artifact under analysis. Artifact information (characteristics), recorded on the data entry forms by the analysts, was entered into the system. The system was then used to enhance the artifact records with the addition of provenience information. Berger maintains a complete type and attribute coding book for each material class.

The artifact coding system employs a Type/SubType system developed by Berger's Cultural Resources Division. The format for the historic artifacts is based on the South/Noël Hume typology (South 1977), as modified for use in a computerized system (Berger 1987).

The Type/SubType system is comprised of a three-letter code followed by a number (integer). The first letter of the code represents the specific Class to which that artifact belongs: C, for Historic Ceramics; G, for Curved (Vessel) Glass; S, for Small Finds/Architectural; P, for Historic Tobacco Pipes; and Z, for Faunal. The second and third letters and number represent further subdivisions of the artifact groups within the class and are defined in the below discussions for each analytical class.

Pattern (group and class) codes, based on form or material type, were assigned to each artifact entry. The pattern categories used follow the work of South (1977), as modified by Berger (1987).

The Notes field allows for individual written comments applicable to a specific entry. In general, notes are used to describe particulars of decorative motifs or unusual characteristics, or to record bibliographic references used for identification or dating. Comment codes refer to information not covered in other fields. Codes 1 through 20 apply to all analytical categories, while the remaining numbers are class-specific.

3.2.3 Historic Ceramic Analysis

The ceramic tabulation provides the following information: identification of ware types and techniques of surface decoration; dates based on manufacturing and decorative techniques and, if present, maker's marks; identification of vessel forms and functions; and descriptions of decoration motifs. The following are explanations of the variables used in the coding process.

Type/SubType. As mentioned previously, the first letter in the type codes for Historic Ceramics is always C. The second letter refers to general ware groups: E, for Coarse Earthenwares; R, for Refined Earthenwares; S, for Coarse Stonewares; F, for Refined Stonewares; and P, for Porcelain. The third letter refers to specific ware types: e.g., R, for Redware; W, for Whiteware; L, for Gray or Buff Stoneware; and B, for Brown Stoneware. The Subtype numbers refer to particular decorative treatments or named types: e.g., CRW50 – Whiteware with Blue Transfer-Printed Decoration.

Begin/End Dates. Type/Subtype may be descriptive and undated or have specific dates which are automatically assigned by the database. Sources for these dates include, but are not limited to: Cameron (1986), Denker and Denker (1985), South (1977), and Wetherbee (1980, 1985). When more precise dates can be determined from maker's marks or particular decorations or forms, these fields are entered manually. Sources used for identification of Maker's Marks (Var 1) or Decoration/Motif (Var 4) include Barber (1968), Gates & Ormerod (1982), Godden (1964), Kowalsky and Kowalsky (1999), and Lehner (1988).

Form (Var 5). Form indicates the shape and possible function of the complete vessel as represented by the sherds present. General categories, such as "Tableware, Hollowware," are used for sherds whose small size or ambiguous characteristics make determination of form problematical. **Part (Var 7)** is used to indicate what part of a vessel is represented by the sherd(s) present.

3.2.4 Curved (Vessel) Glass Analysis

The glass artifacts from the collection were broken down, for analytical purposes, into three functionally distinct groupings based on Bottle, Table, and Lighting use-categories. Window glass, considered more functionally inclusive under an architectural group of artifacts, was subsumed for analysis under Small Finds/Architectural materials, as discussed below. The following are explanations of the variables used in the coding process.

Type/Subtype. The first letter of the Type code for Glass is always G. The second letter denotes the functional groupings: B, for Bottle; T, for Table; and L, for Lighting. The third letter denotes specific function within the appropriate use category, e.g., M, for Malt; T, for Tumbler; and L, for Lamp. The Subtype numbers denotes vessel form, e.g., GBM6 – Lager Bottle; GTT46 – Tumbler/Ribbed; and GLL9 – Lamp Chimney Fragment/Rim.

All artifacts identified as to specific function and form were coded as such regardless of the degree of fragmentation. The specific vessel part(s) encountered are indicated by the coding of the appropriate fields, i.e., Base (Var 7) or Finish (Var 8).

Begin/End Date. Dating of the glass artifacts was completed according to established diagnostic criteria. These criteria, utilized either singly or in combination, can include various technological aspects of glass manufacture such as finish treatments, tooling methods, emponthing techniques, mold markings, Embossments/Labels (Var 11), Brand (Var 3), Maker's Marks (Var 1), and Color (Var 9). Sources for glass dating include, but are not limited to: Fike (1987), Jones and Sullivan (1985), Leif (1965), and Toulouse (1971, 1969).

Finish (Var 8). Finish and rim type were identified as specific types within one-part (100s), two-part (200s), and three-part (300s) categories. Common names such as "Blob-top", "Crown", and "Screw", were used when appropriate.

Base (Var 7). The majority of coded base types in the collection indicate the marks on the basal surfaces of glassware. "Snap case" indicates the lack of any markings when this device was used to hold a bottle in place while its finish was formed. Machine-made basal markings were also coded, if identifiable.

Manufacturing Technique (Var 5). Manufacturing Technique refers to the distinctive mold seams and markings found on the bodies (and sometimes bases, finishes, or rims) of glassware.

3.2.5 Small Finds / Architectural Analysis

For the small finds/architectural analysis, each artifact was identified by its group and class, Material Type (Var 3) and Part/Portion (Var 6), and received a count and/or weight. Additional information, including Characteristic (Var 5) and Color (Var 9), was recorded as identified for the individual artifacts. Definitions of the variables used are presented below.

Type/Subtype. The first letter of the Type code for Small Finds/Architectural is always S. The second letter denotes the group of the artifact (e.g., A, for Architecture), and the third letter denotes a class within that group (e.g., F, for Fasteners). The Subtype number denotes the specific artifact type, (e.g., SAF6 – Wire Nail).

Begin/End Date. Dates for certain artifact were generated in the database based on the Type/Subtype. Other dates were entered manually and were based on various artifact characteristics. References used for dating of artifacts includes, but is not limited to: Edwards and Wells (1993), Lavitt (1983), and Luscomb (1967).

Characteristic (Var 5). A modifier that best described the form or manufacturing technique of each artifact was entered in this field.

3.2.6 Historic Tobacco Pipes Analysis

Pipes were identified by morphological type, Part (Var. 7), and Stem Bore Diameter (Var 9). The analysis is designed for descriptive purpose and to generate dates whenever possible.

Type/Subtype. The first and second letters of the Type code for Historic Tobacco Pipes are PT. The third letter identifies the artifact as a stem (S), a general white clay bowl (E), or a bone composite pipe (W). The Subtype number further indicates specific bowl shapes and date ranges, when.

3.2.7 Faunal Analysis

The analysis of the faunal material allowed for the identification of species, Element (Var 5) and any modification to the specimen (e.g., Burning [Var 7], Butchering [Var 1], etc.). Identifications were made with the aid of reference materials, which include, but are not limited to Gilbert (1973) and Olsen (1964).

Type/SubType. The first letter of the Type code for Faunal material is Z (for zoological). The second letter denotes the class of the animal (i.e., M, for Mammal; B, for Bird, etc.). The third letter distinguishes groups with the class (e.g., D, for Domestic; W, for Wild, etc.). The numeric Subtype code identifies species.

4.0 RESULTS OF ARCHAEOLOGICAL SURVEY

4.1 Trench 1

Trench 1 measured 10 feet north-south and 50-feet west-east and was positioned west-east at the extreme rear of Lot 27 to determine the presence or absence of the location of a historic privy or other features likely located within the rear of the lot (see Figure 10). The mechanical excavation of Trench 1 progressed in 1.0-foot increments (Photo 1). The mechanical excavation of Trench 1 was stopped at 3.0-feet below the current ground surface due to the presence of a large dark brown (10YR3/3) rectangular feature (Feature 1) with large amounts of ash and cinder surrounded by dark yellowish brown (10YR4/6) silty clay loam subsoil at that depth (Photo 2). To expose the southern limits of Feature 1, an extension to Trench 1 was mechanically excavated to the top of the feature. That extension measured 2.5-feet north-south and 11-feet west-east. No additional archaeological features, other than Feature 1, were discovered within Trench 1.

The typical soil profile of this portion of Lot 27, as revealed in Trench 1, consisted of a 0.3-foot thick asphalt layer overlying a 0.2 – 0.3-foot thick layer of crush and run gravels with very dark grayish brown (10YR3/2) sandy loam (Figure 11; Photo 3). Following these pavement layers, which date to the 1980s, were two layers of fill that extended to 1.8-feet below the current ground surface. This fill was likely necessary to level the rear portion of Lot 27 to create the parking lot, as the natural topography of the lot slopes to the south. An intact dark brown (10YR3/3) sandy clay loam buried A-horizon, or historic ground surface, measuring 0.6-feet thick, was encountered beneath these fill layers. A 0.4-foot thick dark brown (10YR3/3) sandy clay loam mottled with dark yellowish brown (10YR4/6) clay loam transitional soil layer with a diffuse boundary was noted beneath the buried historic ground surface and which overlies a dark yellowish brown (10YR4/6) clay loam natural B-horizon that was excavated to a depth of between 3.0 and 3.5-feet below the current ground surface.

A concrete curb was observed on the surface prior to the excavation of Trench 1. This curb measured 0.8-foot wide and extended the entire width of Lot 27 from the fence line along Richmond Street westward to the wall of the abandoned factory building. This curb was likely installed in the 1980s when Lot 27 was converted into a parking lot. During the excavation of Trench 1, which required the removal of the curb, it was noted that the concrete curb was underlain by a foundation base of mixture of cement and fragmented bricks that extended to a depth of 1.8-feet below the ground surface (Figure 12; Photo 4). Several fragments of plastic bags were recovered from beneath this brick and cement base which indicate the more recent origin of the curb. No feature number was assigned to this curb.

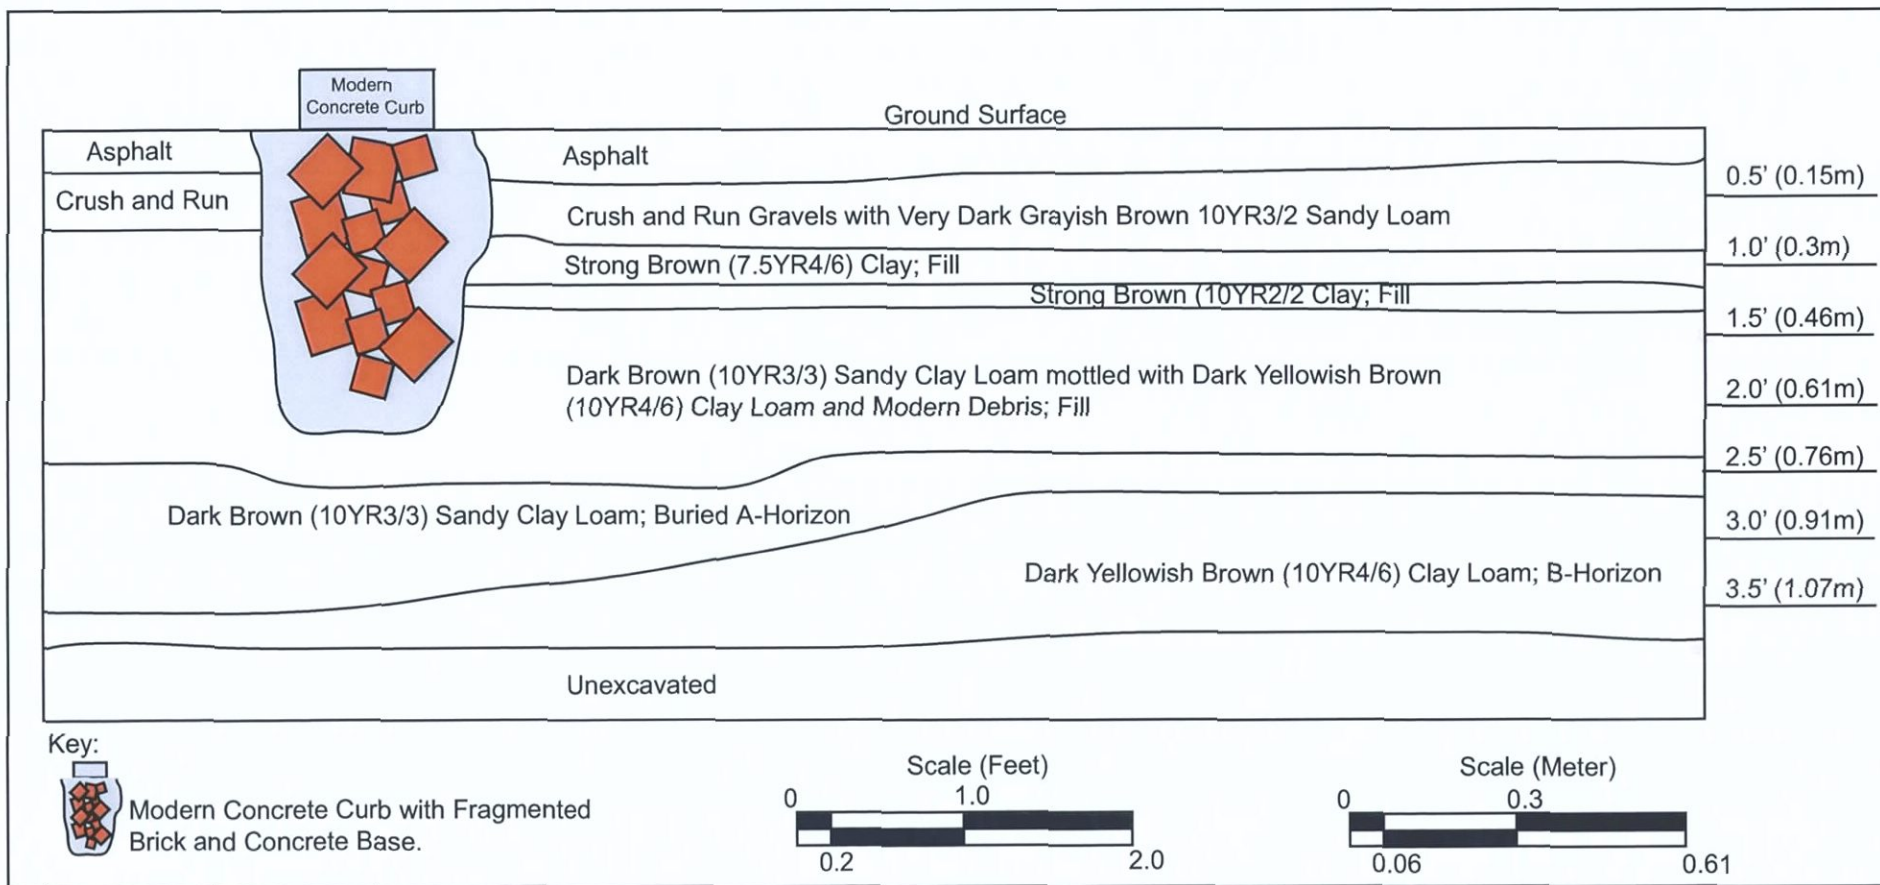

FIGURE 12: Trench 1 West Profile.

Photo 4: Section of Concrete Curb Showing Fragmentary Bricks and Mortar Base.

4.1.1 Feature 1

The western edge of Feature 1 was noted 12.0-feet east of the western edge of Trench 1 at 3.0-feet below the ground surface. The portion of the feature that was initially exposed measured 7.0-feet west-east and 5.0-feet north-south. After the southern extent of Trench 1 was widened to expose the entire limits of Feature 1, it became apparent that Feature 1, a dark brown (10YR3/3) clay loam with ash and cinder stain which was surrounded by dark yellowish brown (10YR4/6) clay loam subsoil, was oriented with magnetic north and at 3.0-feet below the ground surface, measured 7.0-feet square with rounded northeastern corner (Figure 13; Photo 5). The dimensions of Feature 1, however, changed upon excavation, as at 5.0-feet below the ground surface, the northern extent of the feature tapered to 4.5-feet north-south (Photo 6). Although the eastern half of Feature 1 was not excavated, it is likely that the feature was 4.5-feet-square. Evidence of a wood lining was noted at 8.5-feet below the ground surface in the form of wood staining and a few fragments of wood along the edge of the feature (Photo 7). Given the location of Feature 1, at the extreme rear of Lot 27 as well as the dimensions of the feature, Feature 1 is interpreted as a wood-lined privy shaft. The reduction in size of the shaft at lower depths is likely related to the manner in which the shaft was originally excavated for use as a privy.

As mentioned earlier, it was deemed necessary to excavate and document Feature 1 in 0.5-foot arbitrary levels, unless an observable distinction in soils was encountered due to the largely homogeneous fill soils/ash/cinder. Such a method of excavation and recordation of deep shaft features is a common practice and provides an opportunity to maintain vertical and temporal control of artifact deposits within an otherwise non-stratified homogeneous matrix (Wheeler 2000). A 1/3 sampling of Feature 1 (the northwestern 1/3, which measured 4.0-feet east-west and 5.0-feet north south) was chosen to be removed systematically rather than a 1/2 sampling in order to maintain a stable southern "wall". The systematic excavation of the northwestern 1/3 of Feature 1 was conducted in 0.5-foot increments to a depth of 10.2-feet below the ground surface and in 1.0-foot increments from 10.2-feet to 12.8 feet below the ground surface. The increase in the thickness of the arbitrary levels was based on field observations regarding the similarity of artifacts and their temporal range found throughout the feature.

Due to the safety concerns related to the complete excavation of this portion of the feature at this depth, a shovel test, measuring 1.5-feet in diameter, was excavated in the center of the northwestern portion of Feature 1. That shovel test revealed that Feature 1 extended to 13.6-feet below the current ground surface. An additional 0.4-feet was excavated within the shovel test pit as well as a split spoon auger test that extended to 16.0-feet below the ground surface was excavated in the shovel test pit to confirm that Feature 1 did not continue and that natural subsoil had been exposed. These additional tests revealed a brownish yellow (10YR6/6) medium sand C-horizon from 13.6-feet to 16.0-feet below the ground surface.

A total of 16 arbitrary levels were excavated within the northwestern 1/3 of Feature 1 (Figure 14; Photo 8). No dramatic changes in soil stratigraphy were noted within each of these arbitrary levels. A few distinct bands of ash/cinder were noted within the upper 3.0-feet of the feature. These lenses of ash were very thin, however, and did not represent temporal boundaries because the artifacts above and below these thin lenses possessed the same stylistic attributes, could be cross mended, and/or were very similar in manufacturing date.

The systematic excavation of the northwestern 1/3 of Feature 1 was conducted in 0.5-foot increments to a depth of 10.2-feet below the ground surface (Levels 1 through 12) and in 1.0-foot increments from 10.2-feet to 12.8 feet below the ground surface (Levels 13 through 15) due to the largely homogeneous fill soils consisting of ash/cinder that were present within the feature. Level 16 was excavated within the 1.5-feet in diameter shovel test pit and measured 0.8-feet thick (Photo 9). The increase in the thickness of the arbitrary levels was based on field observations regarding the similarity of artifacts and the similarity of temporal range found within previously excavated levels of the feature fill. Such a method of excavation and recordation of deep shaft features is a common practice which provides an opportunity to maintain vertical and temporal control of artifact deposits within an otherwise non-stratified homogeneous matrix. A 1/3 sampling of Feature 1 (the northwestern 1/3, which measured 4.0-feet east-west and 5.0-feet north south) was chosen to be removed systematically rather than a 1/2 sampling in order to maintain a stable southern profile in addition to an eastern profile.

4.1.2 Analyses and Discussions of Artifacts Recovered from Feature 1

Artifacts recovered from Feature 1 totaled 3,685 or 98% of the entire number of artifacts recovered from the Jamaica Avenue School Site (N=3,749). Of the total number of artifacts that were recovered from the feature, 90.5% (N=3,335) of the total number recovered from Feature 1 were recovered during the systematic investigation of the feature, of which, 31 artifacts were unidentifiable metal or rubber fragments. The remaining 350 artifacts (9.5%) from Feature 1 were collected from general proveniences within the feature. Only the 3,304 artifacts that were recovered from systematically excavated levels and which possess an identifiable function will be discussed further as these artifacts possess the necessary provenience information with which the temporal relationships of each arbitrarily excavated level within Feature 1 and the historic of deposition with the feature in general may be understood.

Artifacts recovered from systematically excavated levels within Feature 1 were categorized by functional group, class of artifact, material type, and stylistic attributes. Information including external decoration, embossed or impressed makers marks, and/or patent date was also recorded as such information provides details regarding the beginning date of manufacture, origin, and/or specific use of a particular artifact. The functional groups that were represented by the artifacts recovered from each of the sixteen levels excavated within Feature 1 include Activities, Architecture, Business, Clothing, Furnishings, Hardware, Domestic (which includes Kitchen and Household items), Personal, Recreation, and Tobacco. Unidentified fragments were also recovered and cataloged but are excluded from these discussions. Tables 1 and 2 illustrate the number and percentage frequency of each functional grouping within each of the excavated levels within Feature 1. Photos 10 through 17 illustrate a representative sample of the variety of artifacts recovered from Feature 1. Although a variety of very interesting artifacts were recovered from Feature 1, including many locally produced goods, further analyses indicate that all of these artifacts were deposited within the feature at the same time or within a relatively short period of time. As a result, a detailed discussion and descriptions of the individual artifacts is not provided herein. Rather, discussions and analyses of the general trends and vertical and temporal relationships of the artifacts within Feature 1 are provided.

As seen in Tables 1 and 2 and in Chart 1 below, the frequency of the total number of artifacts exhibits a general trend that decreases in number as depth within the feature increases. There are, however, observable and slight decreases in density (<100 artifacts) at Levels 6, 8, and 11 and a dramatic decrease in artifact density (>300 artifacts) between Levels 4 and 6. As the sampling strategy for each excavated level remained fairly constant between Levels 1 and 12 the number of artifacts in any given level, as well as the density trends, is presumed to be unrelated to changes in sampling. The decision to modify the excavated thickness of Levels 13 and 15 from 0.5-foot to 1.0-foot, however, supports the observation of a low density of artifacts recovered from Levels 13 through 15 contrary to an expectation that artifact density would increase with an increase in level thickness.

An understanding of the temporal relationships of each of the excavated levels is significant to the understanding of the creation/filling of Feature 1. To facilitate such an understanding, the terminus post quem (TPQ) or date after which, of each level was determined by using the information gained from the material types, stylistic attributes, decoration, and/or embossed/impressed information to ascertain the beginning and end dates of manufacture of each of the artifacts (Table 3). This TPQ information, indicates that Levels 1 through 8, which contained 73% (N=2415) of the systematically recovered artifacts from Feature 1, were deposited after circa 1930. Based on this information the trend in artifact density discussed above, resulted from a single episode that occurred after circa 1930 and in which the majority of the artifacts within Feature 1 were deposited.

Additional analyses of the relationships of the artifact fragments, including minimum ceramic and glass vessel counts and cross mending of artifact fragments, supplement the interpretation that the majority of Feature 1 was filled after circa 1930. An examination of the presence of two or more fragments of a particular and individual ceramic or glass vessel within two or more levels, especially when separated by several feet of feature fill, is a strong indication that the two or more levels are related temporally and were most likely deposited at the same time or within a relatively short period of time.

16	1892	18	9

Artifacts recovered from Feature 1 that were classified within the Domestic group were the most represented artifact group within Feature 1 consisting of 44.8% (N=1,481) of the total number of artifacts systematically recovered from the feature. Domestic artifacts consisted of ceramics, glass (bottle, jar, and tableware), faunal remains (bone and shell), metal can and serving vessels, and small finds related to domestic activities such as utensils and scrub brushes. Table 4 indicates the frequencies of each of the patterns groups/classes of domestic artifacts that were recovered from all of the excavated levels within Feature 1. It is important to note that the Domestic group represents 44.8% (N=1481) of the total number of artifacts that were recovered from the systematic excavation of Feature 1. As seen in Chart 2, Domestic artifacts were recovered from every level within Feature 1 and the

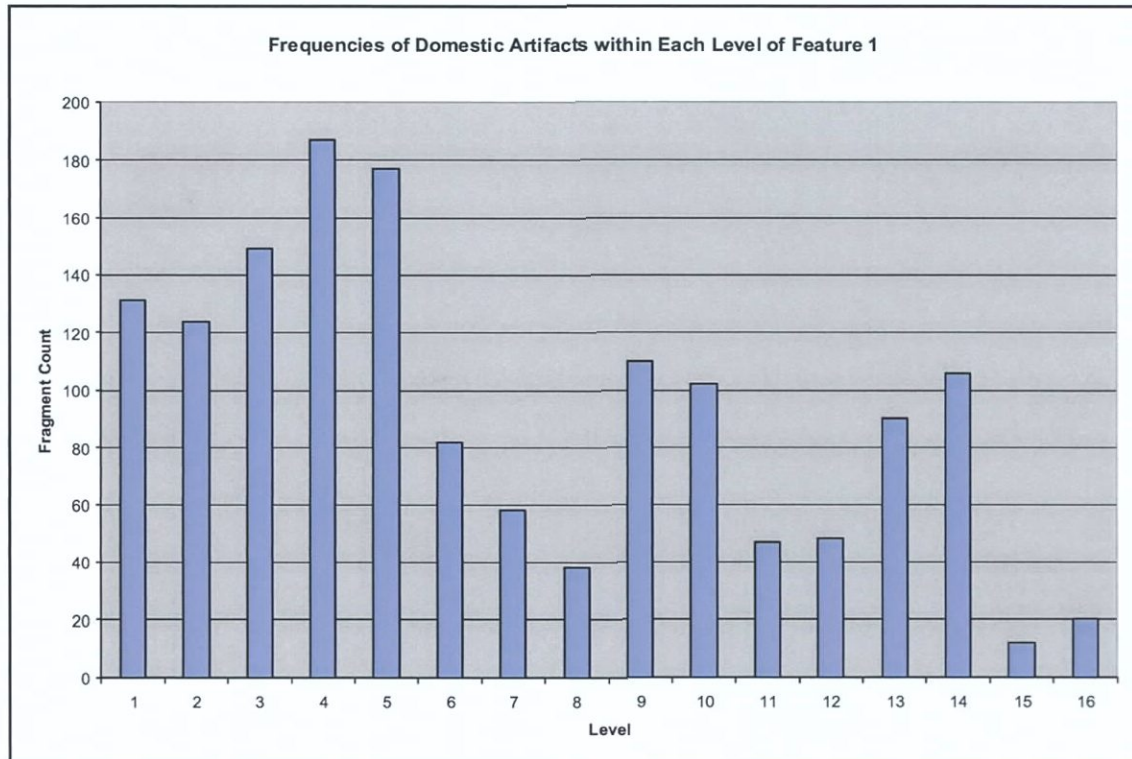

Chart 2: Frequencies of Domestic Artifacts within Each Level of Feature 1.

frequency with which these artifacts were recovered generally decreased as the excavation of Feature 1 progressed from Level 1 to Level 16. Dramatic decreases in Domestic artifacts were noted within Levels 6 through 8, Levels 11 and 12, and Levels 15 and 16. Decreases in the number of artifacts within the above mentioned levels may be due, in part, to the presence of more intact/larger fragments of artifacts as in the cases of Levels 6, 15 and, 16 (Chart 3), or the greater presence of other artifact groups within each of those particular levels in the cases of Levels 7 and 12 (Chart 4). The relative number of more intact/larger fragments of artifacts is also evident in Level 14 in which nineteen intact/mendable nineteenth century stoneware porter/ale bottles were discovered in the northeastern corner of the excavated portion of Feature 1 (Photo 18). Sixteen of these bottles were incised with the mark of "A. EDDY", one of the bottles was incised with the mark of "W.P. KNICKERBOCKER", one was incised with the mark of "S.ALVEY/ BROOCKLINN", and one was incised with the mark of "D. LUCE". William Pond "W.P." Knickerbocker produced soda, mineral water, porter, and ale bottles made of stoneware and glass in Manhattan from 1848 to 1863 (Guest 2006). No information was discovered regarding the other stoneware bottle makers but due to the shape of each of these bottles it is likely that they too were manufactured in the mid-to late nineteenth century.

A small variety of ceramic ware types were represented within the artifacts of the Domestic group that were recovered from Feature 1 (Table 5). The most prevalent ceramic ware types were Ironstone (30.36%), Redware Flower Pot Fragments (22.47%), and Whiteware (18.02%). These ceramic ware types also represented a variety of vessel forms and external decoration (Table 6). The most prevalent vessel forms included Flower pots (22.47%), Saucers (15.18%), Bowls (13.97%), and Unidentifiable Tableware (10.53%). External decorative motifs were also varied within the ceramic assemblage recovered from Feature 1 (Table 7). Although undecorated wares were most common, representing some 45.55% (N=225) of the Domestic ceramic assemblage, Transfer printed wares were well represented at 21.66% (N=107). The ceramic assemblage also contained fragments that possessed a large variety of makers marks that were useful in dating the assemblage from Feature 1.

Photos 19, 20, and 21 represent the most common Transfer Printed motif represented within Feature 1, a pattern which was also present on a variety of ceramic vessel forms. This teal colored small scale floral motif was manufactured by the Ohio China Company of East Palestine, Ohio between 1902 and 1912. Photo 22 illustrates a portion of a less common mulberry transfer printed plate in the Roselle pattern, manufactured by J.M. and Sons, England between 1890 and 1897. Photo 23 illustrates one of the more interesting motifs recovered from Feature 1, an overglaze decal plate made by the Burford Brothers Pottery Co. of Liverpool, Ohio, that was given compliments of, and which is decorated with the image of, the Joseph H. Bauland's Great Cash Store, located in the Offerman Building at 503-13 Fulton Street, Brooklyn, New York. Bauland's Great Cash Store operated in Brooklyn from 1897 to circa 1903 (Postal 2005:6).

A review of the vertical provenience of the ceramic fragments that were used to construct the count of minimum ceramic vessels strengthens and enhances the interpretation of the TPQ data, which suggested that Levels 1 through 8 are temporally related. Information regarding the minimum number of vessels represented by the artifacts recovered from Feature 1 is provided in detail in Appendix D.

The presence and relationship of a variety of makers marks and the fragments of 39 individual ceramic vessels found within Levels 1 through 16 suggests that these 16 levels, were deposited at the same time or within a relatively short period of time after circa 1930 (Table 8). Supporting the interpretation that the entire contents of Feature 1 were deposited within a relatively short period of time is the fact that ceramic vessels 2, 10, 17, 18, 21, 80, and 126, which appeared in Levels 1 through 5, Level 7, and Level 16 possessed a teal colored small scale floral transfer printed decoration and/or a maker's mark from the Ohio China Company in East Palestine, Ohio, which was in operation from 1902 until 1912 (Lehner 1988:328) (Photos 24 and 25). Further supporting the concept that the deposition of artifacts within Feature 1 occurred within a relatively short period of time is the presence of fragments from vessels 31 and 67, which appear in Levels 5, 10, 12, and 13 which bear the maker's mark of the Sebring Pottery Company, that operated in East Liverpool, Ohio from 1898 to the 1940s (Lehner 1988:414) (Photo 26). The association of fragments of ceramic vessels 31 and 126, made by different companies in Level 5 indicates that the fragments of these and other vessels found within Levels 1 through 13 were indeed deposited at the same time or within a relatively short period of time. Given the TPQ data available for Levels 1 through 13 it is apparent that the deposition occurred sometime after circa 1930. Additionally, although TPQ data for Levels 14 through 16 indicate that these levels were deposited after 1892, the presence of fragments of Vessel # 17 in Levels 1 and 16, whose decoration matches that of other vessels made by the Ohio China Company discussed above indicates that the deposition of all of the levels within Feature 1 is occurred at the same time. Moreover, Level 14 also contained a few smaller fragments of vessels that were present within preceding levels, including fragments of Vessel #s 27, 68, 104, 105, and 129. The presence of a circa 1920s enameled advertisement for Lorillard tobacco within Level 14, and in association with the nineteen intact/mendable nineteenth century stoneware porter/ale bottles were discovered in the northeastern corner of the excavated portion of Feature 1 further indicates that the contents of Feature 1 were deposited sometime after or during the early decades of the twentieth century (Photo 27).

Analyses of the bottle glass recovered from Feature 1 also indicate that the contents of Feature 1 were deposited in the early decades of the twentieth century. A total of 238 bottle glass fragments and/or intact bottles recovered from Feature 1 possess embossed information and/or physical attributes for which exact beginning and end dates of manufacture could be assigned. These bottles occurred throughout all of the excavated levels within Feature 1 and were manufactured between 1858 and 1930 (Tables 9 and 10). The majority of these bottles have beginning dates of manufacture between 1870 and 1890 (N=153 or 65%) but it is important to note that the majority of the bottles that were first manufactured between 1858 and 1890 were also made until 1915 (N=202 or 86%). Overall, the majority of the bottles recovered from Feature 1 (N=214 or 91%) have end dates of manufacture of between 1906 and 1915. As an analysis of the lag time between manufacture and deposition indicates that the overall time between all of the dateable bottles recovered from Feature 1 is 37.5 years (Table 11), which is an extremely lengthy amount of time for a such disposable items to be retained, it is a more likely interpretation that these bottles were largely manufactured in the early decades of the twentieth century and then discarded into Feature 1 circa 1930.

Table 9: Beginning Date of Manufacture of Glass Bottles Recovered from Feature 1.

1892		1930-1892 = 37.51 years		

In addition to the enormous amount of household rubbish within contexts of Feature 1 that date to after circa 1930 (Levels 1 through 13) the presence of architectural debris corresponds closely with historical documentation that the residence on Lot 27 was demolished circa 1930 and was replaced with an automobile repair shop. As a result, the fill and artifacts from Levels 1 through 13 of Feature 1 are likely related to the removal of the some of the contents of the house and architectural elements prior to demolition and their discard within the open privy shaft within the property.

The demolition of the building on Lot 27 undoubtedly created a great quantity of architectural debris. Artifacts recovered from Feature 1 that were classified within the Architectural group consisted of architectural elements from the interior of the residence and included nails/spikes (machine cut and wire drawn), window glass, brackets, door knobs, pipes, light bulbs, hinges, roofing material, and bathroom fixtures. Table 12 indicates the frequencies of each of the patterns groups/classes of architectural artifacts that were recovered from all of the excavated levels within Feature 1. It is important to note that no large brick fragments or mortar, however, were noted or recovered from within Feature 1, suggesting that the deposition of the architectural debris recovered from the Levels 1 through 13, which consisted mainly of window glass and nails, was debris from a more controlled demolition of interior architectural elements.

Significant to the interpretation of the depositional history of Feature 1 is that the deepest, and therefore earliest, appearance of architectural artifacts is within Level 13 and which is followed by a punctuated increase in number throughout the uppermost levels of the feature (Chart 5). The majority of architectural debris was recovered from Levels 1 through 4 of Feature 1 and the presence of large amounts of architectural debris within shaft feature contexts, like Feature 1, typically represents the last stages of deposition within such features (Wheeler 2000:12). This observation further supports the previous determinations that the deposition of artifacts within Feature 1 is related to the demolition of the residence on the lot circa 1930.

Table 12: Types of Architectural Artifacts Recovered from Feature 1.

Pattern Group / Class	Count	Percent of Group Total	Percent of Feature 1 Artifacts (N=3,304)
Door Parts	10	0.86%	0.30%

Total	1163	100.00%	35.20%

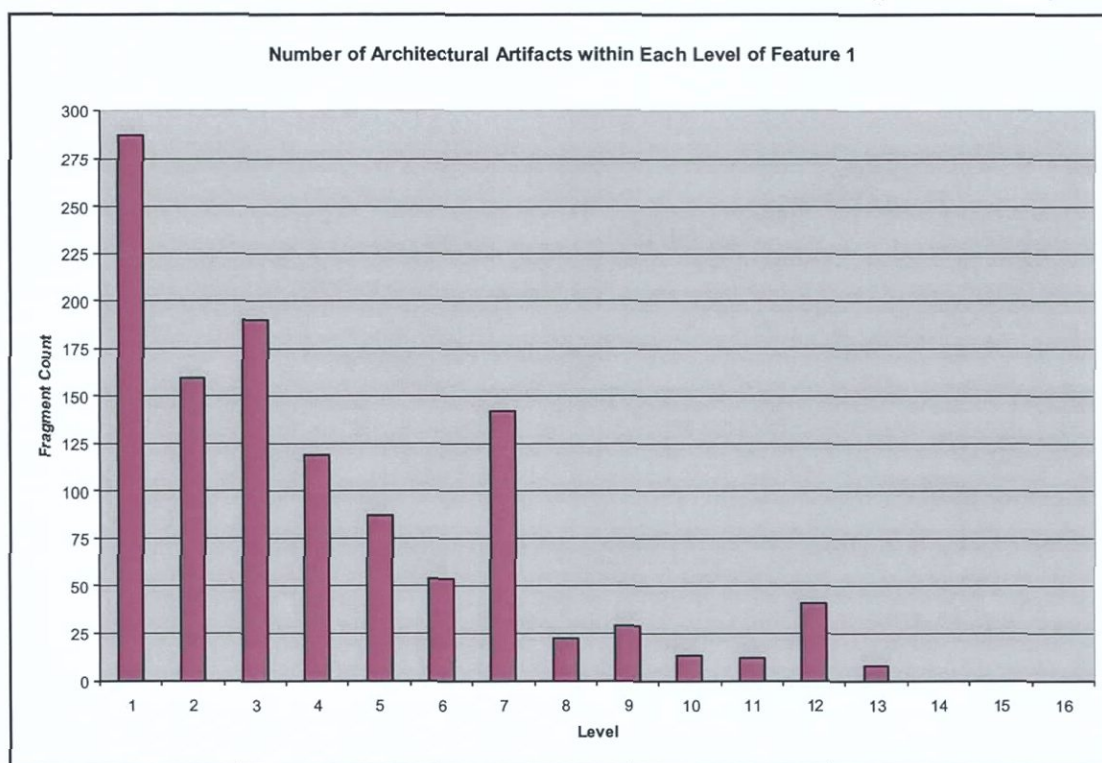

Chart 5: Frequency of Architectural Artifacts within each Level of Feature 1.

4.1.3 Summary of Analyses of Feature 1

In sum, the spatial relationship of Feature 1 at the extreme rear of Lot 27 and the dimensions of the feature as well as the presence of wood staining along the edges of the feature indicates that Feature 1 was a wood-lined privy shaft that was created on Lot 27 prior to the availability of municipal water and sewerage services in 1885. Analyses of the vertical and temporal relationships of the contents of Feature 1, however, indicate that the contents of the feature were deposited in a single episode which occurred circa 1930.

The deposition of artifacts and debris within Feature 1 corresponds closely with the demolition of the residence circa 1930 and is likely related to the removal and deposition of a portion of the contents of the residence into the open privy shaft prior to the demolition of the house. Although some mid-nineteenth century artifacts were recovered from Feature 1, such as tobacco pipe stem fragments, the overall lack of distinctly intact earlier mid-nineteenth century deposits within Feature 1 is likely due to the fact that the privy shaft had been cleaned of its contents immediately prior to the installation of municipal sewerage in 1885.

As a result, this privy shaft does not contain evidence of cultural behavior that can be directly associated with the mid-nineteenth century residents of historic Lot 27 and as such, the site is not recommended eligible for listing on the National or New York State Registers of Historic Places (NRHP/NYSRHP) as this deposit will not significantly add to our knowledge of the historic behaviors of the historic occupants of historic Lot 27.

4.2 Trench 2

Trench 2 measured 12.7-feet west-east and 40-feet north-south and was positioned north-south in the center of the lot extending from the center of the northern edge of Trench 1 to determine the presence or absence of additional cultural features within the central portion of the lot. The mechanical excavation of Trench 2 progressed in 1.0-foot increments (Photo 28). The mechanical excavation of Trench 2 was stopped at 3.0-feet below the current ground surface due to the existence of several observable soil stains/features at that depth as well as a brick and concrete wall feature at the northern edge of the trench (Photo 29). Mechanical excavation within Trench 2, however, continued in 1.0-foot increments to a depth of 7.5-feet below the current ground surface to determine the presence or absence of additional cultural features and to obtain a vertical soil profile of the soils down to that depth subsequent to the systematic documentation and excavation of all features discovered within Trench 2 (Photo 30).

The typical soil profile (Figure 15; Photo 31) revealed by Trench 2 consisted of a 0.3-foot thick asphalt layer overlying a 0.2 – 0.3-foot thick layer of crush and run gravels with very dark grayish brown (10YR3/2) sandy loam. Following these pavement layers, which date to the 1980s, were two layers of fill that extended to 1.8-feet below the current ground surface. This fill was likely necessary to level Lot 27 to create the parking lot, as the natural topography of the lot slopes to the south. An intact dark brown (10YR3/3) sandy clay loam buried A-horizon, or historic ground surface, measuring 0.6-feet thick, was encountered beneath these fill layers. A 0.4-foot thick dark brown (10YR3/3) sandy clay loam mottled with dark yellowish brown (10YR4/6) clay loam transitional soil layer with a diffuse boundary was noted beneath the buried historic ground surface and which overlies a dark yellowish brown (10YR4/6) clay loam natural B-horizon that was extended to a depth of 5.0-feet below the current ground surface. Immediately underlying the B-Horizon was a layer of a dark yellowish brown (10YR4/6) medium sand that extended to approximately 6.0-feet below the ground surface followed by a brownish yellow (10YR6/6) medium sand with medium sized cobbles (glacial till) that was excavated to a depth of 7.5-feet below the ground surface. No additional features were noted within Trench 2 beyond 3.0-feet below the ground surface.

Photo 29: Portion of Trench 2 Showing Features Exposed at 3.0-Feet Below the Ground Surface. View Northeast.

Photo 30: Eastern Soil Profile of Trench 2 to 7.5-Feet, after the Excavation of All Features Within. View East.

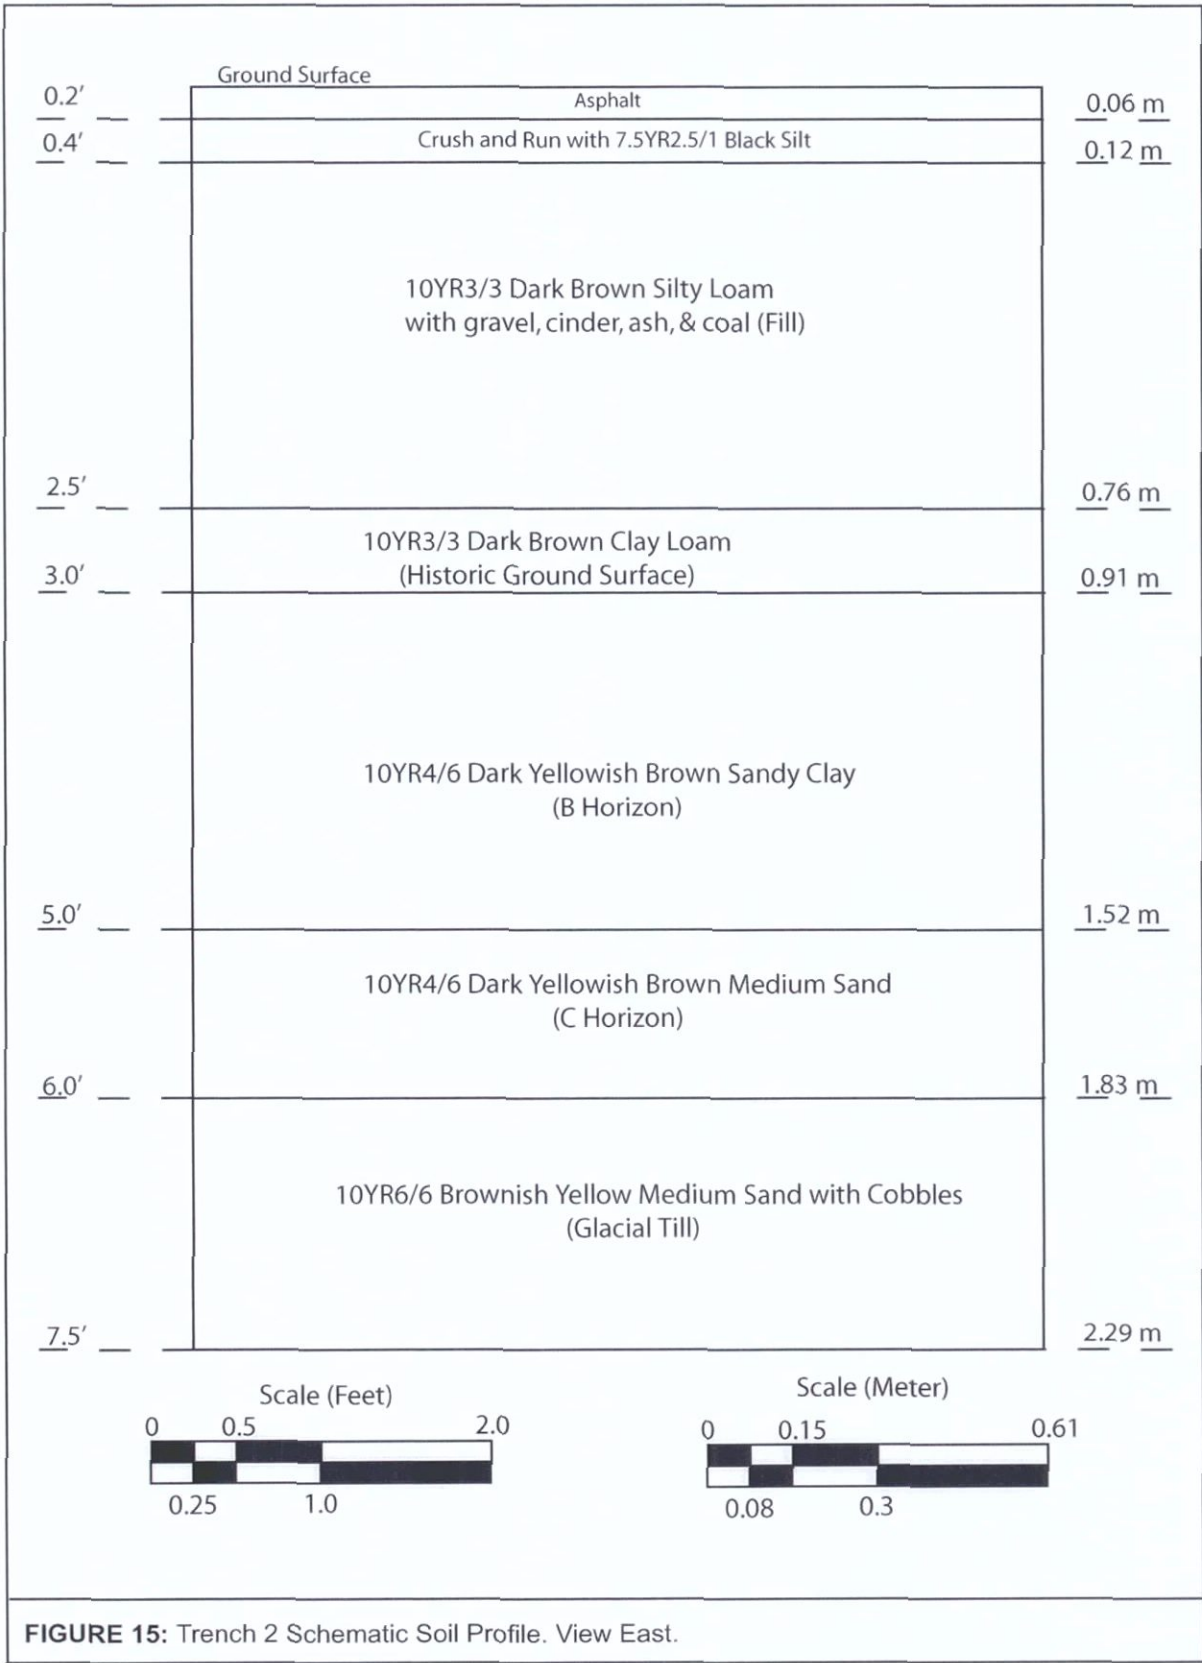

FIGURE 15: Trench 2 Schematic Soil Profile. View East.

Photo 31: Typical Soil Profile of Trench 2 between 0 and 3.0-Feet below the Ground Surface. View East.

A total of eleven (11) cultural features and three (3) root stain features were documented within the natural subsoil at 3.0-feet below the current ground surface in Trench 2 (Table 13) (Figure 16). The three “non-cultural” tree root stain features and brick wall feature were excluded from archaeological excavation. Each of these features is discussed individually below.

Table 13: Functions of Features Discovered within Trench 2.

Feature	Function	Dimensions		Shape
		North-South	East-West	
2	Posthole	1.3	1.1	Square
3	Tree Root	1.0	.05	Linear
4	Posthole	1.0	0.8	Oval
5	Posthole	1.1	1.1	Circular
6	Posthole/Post Mold	2.0	1.4	Rectangular
7	Posthole/Post Mold	1.3	1.3	Square
8	Planting	1.5	1.0	Oval
9	Planting	1.0	1.5	Oval
10	Posthole	2.4	1.0	Rectangular
11	Trash Pit	2.0	1.2	Rectangular
12	Tree Root	0.5	0.5	Circular
13	Tree Root	1.0	1.0	Three Circular Tap Root Stains
14	Planting	1.0	2.0	Rectangular
15	Southern Wall of 1934-1980 Auto Repair Building	1.0	12.7	Linear

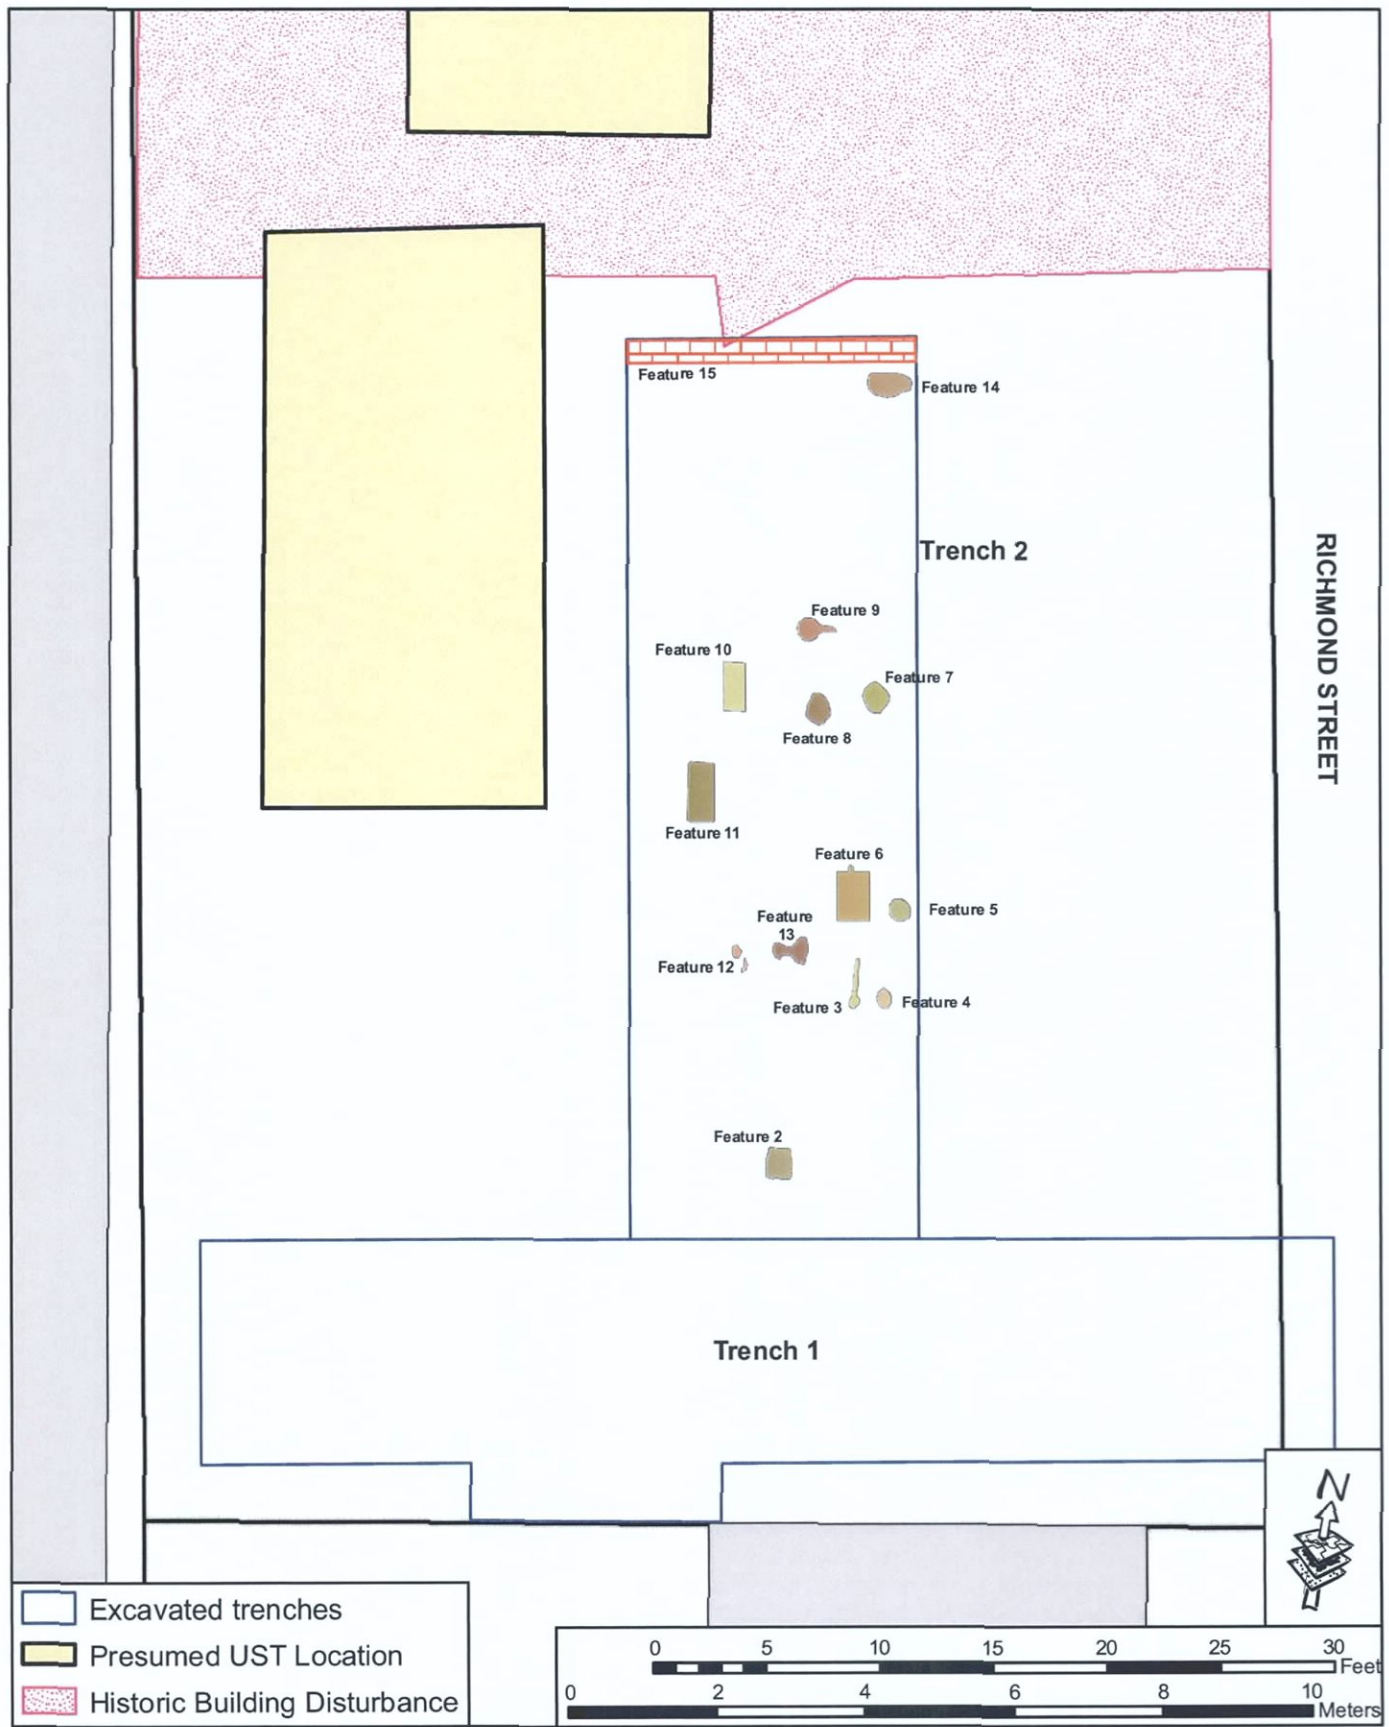

FIGURE 16: Location of Identified Archaeological Features within Trench 2

SOURCE: Berger Field Data 2006; NYCEMap GIS

4.2.1 Feature 2

Feature 2 was a roughly square dark brown (10YR3/3) clay loam stain that measured 1.3-feet north-south by 1.1-feet east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 2 was discovered 5.0-feet north of the southern edge and 5.5-feet west of the eastern edge of Trench 2 at 3.0-feet below the ground surface (Photo 32). Excavation of the entire contents of the feature revealed that Feature 2 had a flat base and extended to 3.6-feet below the current ground surface or 1.8-feet below the buried historic ground surface. Although no evidence of a post mold was noted within Feature 2, it is likely, given the shape and association with similar features within Trench 2, that Feature 2 was a post hole, possibly for a fence that may have separated the two lots that would become Lot 27 sometime after 1893 (see Figures 3 through 9). No artifacts were recovered from Feature 2.

Photo 32: Plan View of Feature 2.

4.2.2 Feature 3

Feature 3 was a 1.0-foot north south by 0.5-foot west-east linear dark brown (10YR3/3) clay loam tree root stain located approximately 10-feet north of the southern edge of Trench 2 and 2.5-feet west of the eastern edge of Trench 2 at 3.0-feet below the current ground surface (Photo 33). Feature 3 was excluded from excavation.

Photo 33: Plan View of Feature 3.

4.2.3 Feature 4

Feature 4 was an oval shaped dark brown (10YR3/3) clay loam stain that measured 1.0-foot north-south by 0.8-foot east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 4 was discovered 10.0-foot north of the southern edge and 1.0-foot west of the eastern edge of Trench 2 at 3.0-foot below the ground surface (Photo 34). Excavation of the entire contents of the feature revealed that Feature 4 had a flat base and extended to 3.6-foot below the current ground surface or 1.8-foot below the buried historic ground surface. Although no evidence of a post mold was noted within Feature 4, it is likely, given the shape and association with similar features within Trench 2, that Feature 4 was a post hole, possibly for a fence that may have separated the two lots that would become Lot 27 sometime after 1893 (see Figures 3 through 9). No artifacts were recovered from Feature 4, but some charcoal, however, was noted within the feature.

Photo 34: Plan View of Feature 4.

4.2.4 Feature 5

Feature 5 was a circular shaped dark brown (10YR3/3) clay loam stain that measured 1.1-foot north-south by 1.1-foot east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 5 was discovered 14.0-foot north of the southern edge and 0.3-foot west of the eastern edge of Trench 2 at 3.0-foot below the ground surface (Photo 35). Excavation of the entire contents of the feature revealed that Feature 5 had a somewhat flat base and extended to 3.3-foot below the current ground surface or 1.5-foot below the buried historic ground surface (Photo 36). Evidence of a small, 0.2-foot in diameter, very dark grayish brown (10YR3/2) clay loam circular post mold was noted within the center of Feature 5. Given the shape, the presence of a post mold, and association with similar features within Trench 2, Feature 5 was a post hole and mold, possibly for a fence that may have separated the two lots that would become Lot 27 sometime after 1893 (see Figures 3 through 9). No artifacts were recovered from Feature 5.

Photo 35: Plan View of Feature 5.

Photo 36: Feature 5, North Profile.

4.2.5 Feature 6

Feature 6 was a rectangular shaped dark brown (10YR3/3) clay loam stain that measured 2.0-feet north-south by 1.4-feet east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 6 was discovered 14.0-feet north of the southern edge and 2.0-feet west of the eastern edge of Trench 2 at 3.0-feet below the ground surface (Photo 37). Excavation of the entire contents of the feature revealed that Feature 6 had a somewhat flat base and extended to 4.1-feet below the current ground surface or 2.3-feet below the buried historic ground surface (Photo 38). Evidence of two very dark grayish brown (10YR3/2) clay loam circular post molds was noted within Feature 6; one post mold measuring 0.7-feet in diameter was located in the center of Feature 6 and one 0.4-feet in diameter post mold was located in the southwestern corner of Feature 6. Given the shape, the presence of post molds, and its association with similar features within Trench 2, Feature 6 functioned as a post hole and mold, possibly for a fence that may have separated the two lots that would become Lot 27 sometime after 1893 (see Figures 3 through 9). Small brick fragments (< 5) and cinder were noted within the posthole and were discarded in the field. No artifacts were recovered from Feature 6.

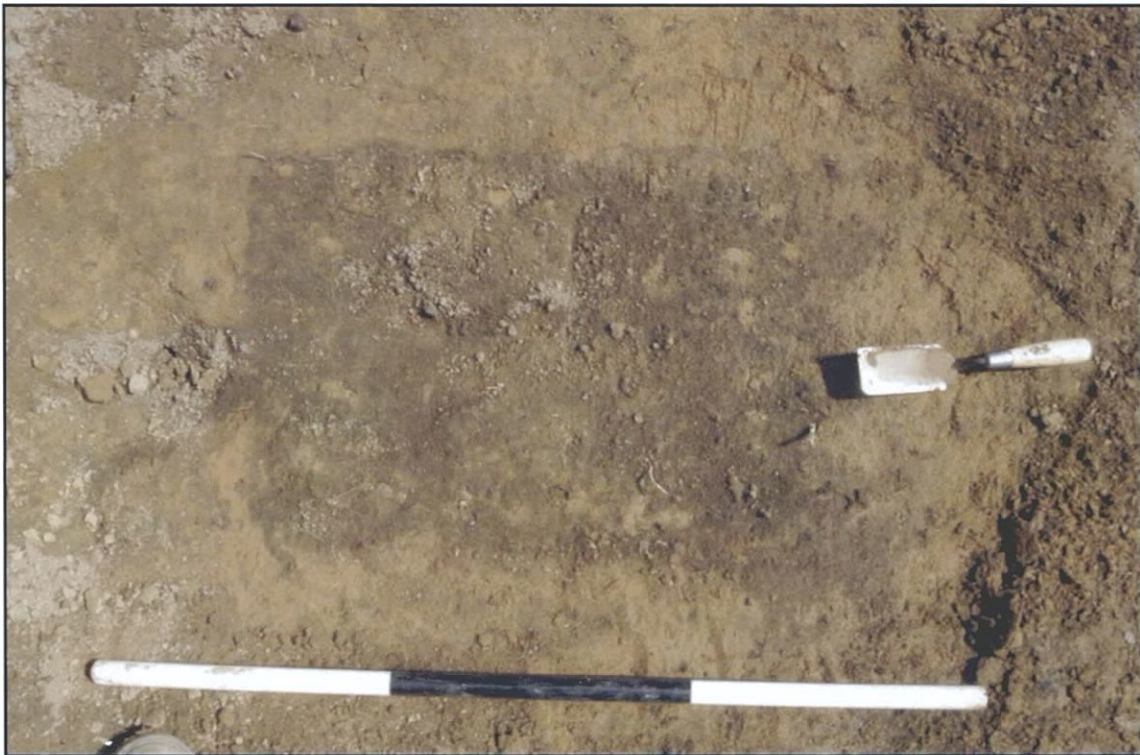

Photo 37: Plan View of Feature 6.

Photo 38: Feature 6, Profile North.

4.2.6 Feature 7

Feature 7 was a rounded square shaped dark brown (10YR3/3) clay loam stain that measured 1.3-feet north-south by 1.3-feet east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 7 was discovered 23.5-feet north of the southern edge and 1.25-feet west of the eastern edge of Trench 2 at 3.0-feet below the ground surface (Photo 39). Excavation of the entire contents of the feature revealed that Feature 7 had a somewhat flat base and extended to 3.5-feet below the current ground surface or 1.7-feet below the buried historic ground surface (Photo 40). Evidence of one very dark grayish brown (10YR3/2) clay loam 0.7-feet by 0.7-feet square post mold was noted within the center of Feature 7. Given the shape, the presence of a post mold, and its association with similar features within Trench 2, Feature 7 functioned as a post hole and mold, possibly for a fence that may have separated the two lots that would become Lot 27 sometime after 1893 (see Figures 3 through 9). Two machine cut nail fragments (Photo 41) were retained from the post hole and some (< 5) cinder was noted within the posthole and was discarded in the field.

Photo 39: Plan View of Feature 7.

Photo 40: Feature 7, Profile North.

Photo 41: Machine cut nail fragments from Feature 7.

4.2.7 Feature 8

Feature 8 was an oval shaped dark brown (10YR3/3) clay loam stain that measured 1.5-feet north-south by 1.0-foot east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 8 was discovered 23.5-feet north of the southern edge and 4.0-feet west of the eastern edge of Trench 2 at 3.0-feet below the ground surface (Photo 42). Excavation of the entire contents of the feature revealed that Feature 8 had a somewhat concave base and extended to 3.5-feet below the current ground surface or 1.7-feet below the buried historic ground surface (Photo 43). No evidence of a post mold was noted within Feature 8. Given the shape of Feature 8 and the lack of a discernable post mold it is likely that Feature 8 was a planting hole. No artifacts were retained from Feature 8 but some cinder (< 5) and coal (< 5) were noted within the feature and were discarded in the field.

Photo 42: Plan View of Feature 8.

Photo 43: Feature 8, Profile North.

4.2.8 Feature 9

Feature 9 was an oval shaped dark brown (10YR3/3) clay loam stain that measured 1.0-foot north-south by 1.5-feet east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 9 was discovered 27.0-feet north of the southern edge and 4.1-feet west of the eastern edge of Trench 2 at 3.0-feet below the ground surface (Photo 44). Excavation of the entire contents of the feature revealed that Feature 9 had a conical base and extended to 3.6-feet below the current ground surface or 1.8-feet below the buried historic ground surface (Photo 45). Evidence of one very dark grayish brown (10YR3/2) clay loam 0.5-foot diameter circular post mold was noted within the center of Feature 9. Given the shape, the presence of a post mold, and its association with similar features within Trench 2, Feature 9 functioned as a post hole and mold, possibly for a fence that may have separated the two lots that would become Lot 27 sometime after 1893 (see Figures 3 through 9). One fragment of Yellowware with a Rockingham glaze was retained from Feature 9 and some cinder (< 5) and coal (<5) were noted within the feature and were discarded in the field (Photo 46).

Photo 44: Plan View of Feature 9.

Photo 45: Feature 9, Profile East.

Photo 46: Rockingham Fragment from Feature 9.

4.2.9 Feature 10

Feature 10 was a rectangular shaped dark brown (10YR3/3) clay loam stain that measured 2.4-feet north-south by 1.0 -feet east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 10 was discovered 23.0-feet north of the southern edge and 7.5-feet west of the eastern edge of Trench 2 at 3.0-feet below the ground surface (Photo 47). Excavation of the entire contents of the feature revealed that Feature 10 had a conical base and extended to 3.6-feet below the current ground surface or 1.8-feet below the buried historic ground surface (Photo 48). Although no evidence of a post mold was noted within Feature 10, it is likely, given the shape and association with similar features within Trench 2, that Feature 10 was a post hole, possibly for a fence that may have separated the two lots that would become Lot 27 sometime after 1893 (see Figures 3 through 9). No artifacts were retained from Feature 10 but some cinder (< 5) and coal (<5) were noted within the feature and were discarded in the field.

Photo 47: Plan View of Feature 10.

Photo 48: Profile of Feature 10. View North.

4.2.10 Feature 11

Feature 11 was a rectangular shaped dark brown (10YR3/3) clay loam stain that measured 2.0-feet north-south by 1.2 -feet east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 11 was discovered 18.6-feet north of the southern edge and 9.0-feet west of the eastern edge of Trench 2 at 3.0-feet below the ground surface (Photo 49). Excavation of the entire contents of the feature revealed that Feature 11 had a flat base and extended to 3.5-feet below the current ground surface or 1.7-feet below the buried historic ground surface (Photo 50). In addition to cinder (< 5) and coal (<5) which was noted and discarded in the field, *fifty-six artifacts were retained* from Feature 11 (Table 14). Ceramic fragments recovered from Feature 11 included Ironstone and those of a Yellowware bowl. These ceramic types, however, were manufactured between the mid-nineteenth and early twentieth centuries, and the recovered fragments do not possess decorative attributes that indicate a more specific time period. Photo 51 illustrates a representative sample of the artifacts retained from Feature 11. The majority (48%) of the artifacts recovered from Feature 11 were faunal (N=27) and given the small size of Feature 11 it is likely that this feature was a small trash pit.

Photo 49: Plan View of Feature 11.

Photo 50: Profile of Feature 11. View North.

Table 14: Artifacts Recovered from Feature 11.

Type	Count	Percent
Faunal	27	48.21%
Bottle Glass	2	3.57%
Ceramic	17	30.36%
Architectural	8	14.29%
Clothing	2	3.57%
Total	56	100.00%

Photo 51: Representative Artifacts Recovered from Feature 11.

4.2.11 Feature 12

Feature 12 was a circular shaped dark brown (10YR3/3) clay loam tree tap-root stain that measured 0.6-feet north-south by 0.4-feet east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 12 was discovered 13.0-feet north of the southern edge and 8.0-feet west of the eastern edge of Trench 2 at 3.0-feet below the ground surface (Photo 52). Feature 12 was excluded from excavation.

Photo 52: Plan View of Feature 12.

4.2.12 Feature 13

Feature 13 was a series of three circular/sounded square shaped dark brown (10YR3/3) clay loam tree tap-root stains each of which measured between 0.4 and 0.6-feet north-south by between 0.4 and 0.6-feet east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 13 was discovered 12.0-feet north of the southern edge and 5.0-feet west of the eastern edge of Trench 2 at 3.0-feet below the ground surface (Photo 53). Half of each of the stains associated with Feature 13 were excavated revealing that the dark brown (10YR3/3) clay loam soils within each of these stains extended horizontally through the subsoil indicating that these stains were, in fact, tree roots and excavation was terminated.

Photo 53: Plan View of Feature 13.

4.2.13 Feature 14

Feature 14 was a rectangular shaped dark brown (10YR3/3) clay loam stain that measured 1.5-feet north-south by 1.0-feet east-west, and which was surrounded by a dark yellowish brown (10YR4/6) natural B-horizon subsoil. Feature 14 was discovered 38.0-feet north of the southern edge and 0.2-feet west of the eastern edge of Trench 2 at 3.0-feet below the ground surface (Photo 54). Excavation of the entire contents of the feature revealed that Feature 14 had a somewhat irregular conical base and extended to 3.5-feet below the current ground surface or 1.7-feet below the buried historic ground surface (Photo 55). No evidence of a post mold was noted within Feature 14. Given the shape of Feature 14, the lack of a discernable post mold, and the irregular root-like base of Feature 14 it is likely that Feature 14 was a planting hole. No artifacts were retained from Feature 14 but some cinder (< 5) and coal (<5) were noted within the feature and were discarded in the field.

Photo 54: Plan View of Feature 14.

Photo 55: Feature 14, Profile East.

4.2.14 Feature 15

Feature 15 is a portion of the southern brick and concrete wall of the auto-repair shop building that was constructed on Lot 27 in 1934 and which was demolished in 1980 (Photo 56). The portion of this wall that was exposed in Trench 2 first appeared at 39-feet north of the southern edge of Trench 2 at 0.5-feet below the current ground surface and measured 1.0-foot thick. The soils immediately south of Feature 15 were excavated to 3.0-feet below the current ground surface and did not reveal any evidence of an external builder's trench indicating that such a feature was located on the inside of the building foundation.

Photo 56: Feature 15. View Northwest.

5.0 CONCLUSIONS

The Louis Berger Group, Inc., has completed a Phase IB Archaeological Survey of the Area of Potential Effects of the proposed location of a new school on Block 4102 in Brooklyn, New York to ascertain if archaeological resources are present. This archaeological survey has identified one previously undocumented historic archaeological site, the Jamaica Avenue School Site, comprised of fifteen archaeological features. A New York State archaeological site form was completed for this site and is provided in Appendix E. These archaeological deposits represent features associated with the late nineteenth and early twentieth century occupation of Lot 27 and include 6 post holes (possibly for a fence that may have separated the two lots that would become Lot 27 sometime after 1893), a trash pit, 3 planting holes, 3 root stains, the rear foundation wall of a circa 1930 automobile repair shop, and a privy that was created prior to the installation of water and sewerage services in 1885 but which was cleaned before 1892 and which was filled with debris from the residence that was demolished circa 1930.

Historic background research regarding the ownership and occupations of Lot 27 indicates that although Lot 27 was owned by a single family, the Simonsons, from 1865 until 1925, it is apparent that this family never occupied the residence historically located on the lot. Rather, it is clear that the Simonsons lived on Richmond Street, opposite Lot 27, and rented the property on Lot 27 to several individuals through time. As a result, the artifacts recovered from the Jamaica Avenue School Site can not be attributed to a single individual or family. Furthermore, analyses of the archaeological deposits identified by this archaeological survey do not contain evidence of cultural behavior that can be directly associated with the mid-nineteenth century residents of historic Lot 27 and as such, the site is not recommended eligible for listing on the National or New York State Registers of Historic Places (NRHP/NYSRHP) as these deposits will not significantly add to our knowledge of the historic behaviors of the historic occupants of historic Lot 27.

As a result of this Phase IB archaeological survey and evaluation, the proposed construction will not have an adverse effect on any NRHP/NYSRHP listed or eligible resources. Therefore, it is recommended that no further archaeological work is required within Block 4102, Lot 27 or the remainder of the archaeological APE associated with the proposed Jamaica Avenue School, to be located at the southwestern corner of Jamaica Avenue and Richmond Street in Cypress Hills, Brooklyn, New York.

Dear Mr. Ou:

Thank you for requesting the comments of the Office of Parks, Recreation and Historic Preservation (OPRHP) concerning your project's potential impact/effect upon historic and/or prehistoric cultural resources. Our staff has reviewed the documentation that you provided on your project. Based on this review we concur with the recommendations of the Phase IA archaeological report that Phase IB investigations should be undertaken in the designated areas if they will be impacted by this project.

Please contact me at extension 3291, or by e-mail at douglas.mackey@oprhp.state.ny.us, if you have any questions regarding these comments.

Sincerely

Douglas P. Mackey
Historic Preservation Program Analyst
Archaeology

| <input type="checkbox"/> NONE | | |

PRESENT REPOSITORY OF MATERIALS: Berger Archaeological Laboratory, Marion, IA

8. PREHISTORIC CULTURAL AFFILIATION OR DATE: _____

9. HISTORICAL DOCUMENTATION OF SITE:

The first documentation of a building within Lot 27 appears on the 1866 U.S. Coastal Survey map which shows a single building on Lot 27 fronting Jamaica Avenue. The 1873 Beers map shows that building, along with either a single building, or two attached buildings at the rear lot line on the adjacent Lot 33. The 1886 Robinson atlas and the 1887 Sanborn map of the lot indicate that a second one-story dwelling was constructed on Lot 27 along the western lot line fronting Jamaica Avenue and a one-story outbuilding, possibly a stable, located to the southwest corner of the building that appeared on the 1873 map. Maps from 1887 through 1905 show no changes to Lot 27, with the exception of the removal of the aforementioned stable sometime prior to 1893. By 1908, the building that was located along the western lot line of Lot 27 had been removed, possibly as a consequence of the growing Bates Machine Company complex situated on the adjoining Lot 19, or possibly as a result of some catastrophic event, such as a fire. The 1928 Sanborn Insurance Map shows the first building still in place, however, this same map updated in 1950 shows that residence had been demolished and an automobile repair shop is shown located in the center of Lot 27. This auto repair shop was demolished around 1980 and the entire lot was converted to an asphalt parking lot.

Historic background research regarding the ownership and occupations of Lot 27 indicates that although Lot 27 was owned by a single family, the Simonsons, from 1865 until 1925, it is apparent that this family never occupied the residence historically located on the lot. Rather, it is clear that the Simonsons lived on Richmond Street, opposite Lot 27, and rented the property on Lot 27 to several individuals through time.

10. POSSIBILITY OF SITE DESTRUCTION OR DISTURBANCE:

Yes. Proposed Construction of Jamaica Avenue School.

11. REMARKS:

These archaeological deposits represent features associated with the late nineteenth and early twentieth century occupation of Lot 27 and include 6 post holes (possibly for a fence that may have separated the two lots that would become Lot 27 sometime after 1893), a trash pit, 3 planting holes, 3 root stains, the rear foundation wall of a circa 1930 automobile repair shop, and a privy that was created prior to the installation of water and sewerage services in 1885 but which was cleaned before 1892 and which was filled with debris from the residence that was demolished circa 1930.
