

CROTONA PLAY CENTER, including the bath house, swimming pool, diving pool, bleachers, filter house, retaining wall with seating niches, terrace site of former wading pool and approach stairs, retaining walls, fencing and linking pathways, Fulton Avenue between East 172nd Street and East 174th Street, Borough of The Bronx.

Constructed 1934-1936; Herbert Magoon and others, Architects; Aymar Embury II, Consulting Architect; Gilmore D. Clarke and others, Landscape Architects.

Landmark Site: Tax Map Block 2941, Lot 1 in part, and portions of the adjacent public way, consisting of the property bounded by a line beginning at a point located on the eastern curbline of Fulton Avenue that is approximately 60 feet to the east of the intersection formed by the western curbline of Fulton Avenue and the southern curbline of East 172nd Street, extending southerly approximately 90 feet to a point located on the eastern curbline of Fulton Avenue which intersects with a line extending westerly from the southernmost curbline of the rectangular landing located directly south of southernmost gate of the Crotona Play Center, continuing easterly along that line and southeasterly along the southernmost curbline of the asphalt pedestrian path as it curves northerly and extends across four intersecting paths to the eastern curbline of the asphalt pedestrian path's easternmost point located approximately 320 feet east of the brick retaining wall on the eastern side of the Crotona Play Center, then continuing northerly along that curbline as it curves westerly, crossing three intersecting pedestrian paths, then continuing westerly along a line extending from the northernmost wall of the two-story masonry Crotona Play Center bath house to an intersecting point on the easternmost curbline of the asphalt pedestrian path located approximately 30 feet to the east of the northeast corner of the Crotona Play Center bath house, then continuing northerly along the that curbline to a line intersecting with a line extending easterly from the northernmost point of the curved asphalt pedestrian path located directly north of the former wading pool area, then continuing westerly along that line to the eastern curbline of Fulton Avenue and southerly along the eastern curbline of Fulton Avenue to the point of the beginning.

On January 30, 2007, the Landmarks Preservation Commission held a public hearing on the proposed designation of the Crotona Play Center (LP-2232) including the bath house, swimming pool, diving pool, bleachers, filter house, retaining wall with seating niches, terrace site of former wading pool and approach stairs, retaining walls, fencing and linking pathways, Landmark Site (Item No. 2). The hearing had been duly advertised in accordance with the provisions of law. Twelve witnesses spoke in favor of designation, including Parks Commissioner Adrian Benepe, and representatives from the Municipal Art Society of New York, the Historic Districts Council, the Society for the Architecture of the City, the Preservation League of Staten Island, the New York Landmarks Conservancy, and the Modern Architecture Working Group. The Commission

has also received letters from the Fine Arts Federation of New York and Carnegie Hill Neighbors, Inc., in support of designation. Several of the speakers also expressed support for the larger designation effort of all the WPA-era pools. The site was previously heard on April 13, 1982 (LP-1284), April 3, 1990 and September 11, 1990 (LP-1776).

Summary

The Crotona Play Center is one of a group of eleven immense outdoor swimming pools opened in the summer of 1936 in a series of grand ceremonies presided over by Mayor Fiorello LaGuardia and Parks Commissioner Robert Moses. All of the pools were constructed largely with funding provided by the Works Progress Administration (WPA), one of many New Deal agencies created in the 1930s to address the Great Depression. Designed to accommodate a total of 49,000 users simultaneously at locations scattered throughout New York City's five boroughs, the new pool complexes quickly gained recognition as being among the most remarkable public facilities constructed in the country. The pools were completed just two and a half years after the LaGuardia administration took office, and all but one survives relatively intact today.

While each of the 1936 swimming pool complexes is especially notable for its distinctive and unique design, the eleven facilities shared many of the same basic components. The complexes generally employed low-cost building materials, principally brick and cast stone, and often utilized the streamlined and curvilinear forms of the popular 1930s Art Moderne style. Sited in existing older parks or built on other city-owned land, the grounds surrounding the pool complexes were executed on a similarly grand scale, and included additional recreation areas, connecting pathway systems, and comfort stations. The team of designers, landscape architects and engineers assembled to execute the new pool complexes was comprised largely of staff members and consultants who had earlier worked for Moses at other governmental agencies, including architect Aymar Embury II, landscape architects Gilmore D. Clarke and Allyn R. Jennings, and civil engineers W. Earle Andrews and William H. Latham. Surviving documents also indicate that Moses, himself a long-time swimming enthusiast, gave detailed attention to the designs for the new pool complexes.

The seventh of the complexes to open, the Crotona Play Center was the only one of the WPA-era pools sited in the Borough of the Bronx. Set amidst the rock outcroppings characteristic of Crotona Park, the Crotona Play Center is considered one of the great WPA Art Moderne structures of the Depression era in New York. The main entrance, a towered monumental arched gateway composed of robust geometric forms, is reached from Fulton Avenue by way of an imposing stairway. The entry courtyard features a second-story gallery edged by a decorative brick railing that repeats the half-circle patterning employed for the balconies on the gateway facade. Quarter-round cast stone buttresses and arched clerestory windows are notable features of the exterior of the locker room section of the bath house. The main entrance to the pools from the bath house is distinguished by the decorative brickwork of its segmental arch, and by the ibis-topped center post designed by Frederick G. R. Roth. The bas-relief roundels depicting humorous swimming-related subjects on the rear walls of the seating niches along the eastern edge of the pool complex, also sculpted by Roth, further illustrate the close relationship of fine art and architecture in the WPA-era pools. The decorative arched openings and buttresses of the adjoining filter house reiterate some of the forms utilized for the bath house. The elevated terrace once occupied by a large wading pool on the north side of the bath house is now used as a children's playground.

DESCRIPTION AND ANALYSIS

History of the Crotona Play Center Site¹

The drive to acquire new parkland for the citizens of the City of New York began with Frederick Law Olmsted, who was the chief of the New York City Parks Department's Bureau of Design and Superintendence in the 1870s. His vision for developing the Bronx included a system of parks and parkways that would feature roads following the existing topography rather than a rigid grid system as in Manhattan. City officials rejected his recommendations and dismissed him in 1877. However, his ideas were not forgotten. John Mullaly, editor of the *New York Herald Tribune*, rallied public enthusiasm for the plan. In 1881, the New York Park Association was formed. It was made up of many of the city's leading businessmen and professionals, such as Charles L. Tiffany, Gustav Schwab, Jordan L. Mott, Egbert L. Viele, and H. B. Claflin. They proposed creating new public parkland by preserving large tracts of open land in rural areas that were newly annexed or soon-to-be-annexed to the city. The Association was unsuccessful, however, in persuading the Mayor and the Board of Aldermen to authorize a commission to oversee the selection of new parkland, so they took their case to the New York State Legislature. Despite much political opposition, the Legislature created the Park Commission in 1883. It proposed three large parks: Pelham Bay, Bronx, and Van Cortlandt, as well as three smaller parks: Crotona, Claremont, and Saint Mary's.²

The Crotona Play Center is located along the western boundary of 151 acres of picturesque parkland in the southeast Bronx known as Crotona Park. The majority of the land for the park (135.36 acres) was acquired by the City of New York in 1888, around the same time it acquired 4,000 acres of land for eight other parks and parkways in the Bronx, including Van Cortlandt Park, and the Bronx and Pelham Parkways. The acquisition of parkland during this time was part of a larger nation-wide reform effort to increase the availability of organized play areas in inner cities. Although the city had originally planned to name the park "Bathgate Park" after the family that had long owned the land, a dispute with the Bathgate family led the Parks Department to name the park instead after Croton, an ancient Greek colony famed for its Olympic athletes and also the name of the old New York City aqueduct.

At the time of its acquisition, the area comprising Crotona Park was already famous for its views, trees, and its pond. The site was considered the "eastern crown" of the area, and offered a breathtaking range of views, from the Palisades of New Jersey to the west, to the towers of the Brooklyn Bridge to the south. In a report to the New York State Legislature by the commission selected to locate lands for public parks in the Bronx, it was noted that the Crotona Park lands already had the "indispensable requisites for a park," including "beauty and variety of surface." The committee commended the site for its "luxuriant growth of forest" which provided ample shade even on a "hot summer noon," and commented on the beauty of the "interlacing branches" of the native oak, elm, and magnolia trees, which gave "an impression of solitude and isolation totally at variance with the idea of proximity to a great commercial center [i.e. Manhattan]." The Crotona Park site was also considered a choice location due to its accessibility by means of the Harlem Railroad, the Elevated Railroads, as well as by horse cars. The committee also noted that projected routes of the Suburban Rapid Transit Company along the eastern and western boundaries of the park would ensure that setting aside these grounds as parkland "would not offer any impediment to the growth of the city."

Few improvements were made to Crotona Park before the turn of the century. In the early 1900s, the Parks Department paved the perimeter of the pond and installed a wooden warming hut and concession stand for ice skating purposes. Around this same time, parts of the park were drained and flowering shrubs planted. A new grandstand was also built, to be used for ball games and musical concerts. In 1909, an attempt by the New York State Legislature to locate an arsenal for the National Guard within the park was challenged by local residents and ultimately vetoed by New York City Mayor George B. McClellan Jr. Any such seizure of parkland was considered an unacceptable encroachment on city parks, with the incident declared in the *New York Times* as reinforcement of "the need for continual alertness to preserve the parks." Additional parkland was acquired by the city to complete Crotona Park in 1907 and 1911.

By the 1930s, Crotona Park had begun to decline. In 1934, the *New York Daily Star* reported that the park was suffering from "the deprivations (sic) of the surrounding population," "a wasteland of destroyed land, trampled shrubbery, dying trees, and devastated (sic) erosion." Under the auspices of Mayor Fiorello LaGuardia and his legendary Parks Commissioner, Robert Moses, major changes to Crotona Park were made during the Depression years, including what the *New York Times* referred to in 1938 as a "full-fledged face-

lifting” that took advantage of available Works Progress Administration (WPA) funds. By 1941, Moses had installed numerous new features in the park, including a boathouse on the east side of the pond, five baseball diamonds, 20 tennis courts, 26 handball courts, nine playgrounds, four comfort stations, various picnic and sitting areas, and, of course, the Crotona Play Center complex. In the early 21st century, Crotona Park remains the largest recreation area in the southeast Bronx, and the sixth largest park in the borough.

Fiorello LaGuardia, Robert Moses and the New Deal³

Franklin D. Roosevelt was elected President of the United States in 1932 in the middle of the Great Depression that followed the stock market crash of 1929. Roosevelt promised to rebuild confidence in American capitalism and to improve the nation’s standard of living by creating the New Deal economic program of unprecedented public spending on social programs and construction projects.

New York City had been especially hard hit by the economic downturn,⁴ and its citizens, hoping for change, elected Fiorello H. LaGuardia to the mayoralty of New York City in 1933 as an anti-Tammany Hall reform candidate. A maverick Republican and a five-term congressman from East Harlem, LaGuardia won the mayoral election on the “Fusion” ticket after losing the 1929 mayoral race on the Republican line. The Fusion Conference Committee at first considered running Robert Moses, another Republican, who was appointed Chairman of the New York State Council of Parks in 1924 by his political mentor, Governor Alfred E. Smith, a Tammany Hall Democrat from New York City. However, the committee decided against Moses because of his association with Smith, and chose LaGuardia instead. At the time, Moses was a popular public figure with a reputation as a progressive and as the builder of great parks and parkways like Jones Beach and the Northern State Parkway on Long Island. His endorsement of LaGuardia during the campaign was considered instrumental in securing a victory for LaGuardia. Within a week of the election, LaGuardia chose Moses, a champion of reform politics, as New York City’s new Parks Commissioner.

Moses accepted the position of Commissioner of Parks in the LaGuardia administration on the condition that the five existing independent Parks Departments (one for each borough) would be consolidated into a single department with himself as the sole Commissioner, with authority extending also over the city’s parkways. Moses also demanded to be appointed the Chief Executive Officer of the Triborough Bridge Authority, which was then building the bridge of that name, and that a new agency, the Marine Parkway Authority, which would build a bridge to the Rockaways, be created with himself at the helm. Already in charge of the Long Island State Park Commission, the New York City Council of Parks, the Jones Beach State Park Authority, and the Bethpage State Park Authority, Moses would then be in control of all existing and proposed parks and parkways in the New York metropolitan region, with the exception of areas outside of New York State.

In the 1920s, Moses was at the forefront of the national recreation movement that began in the first decade of the 20th century, led by such men as President Theodore Roosevelt and the lesser-known George D. Butler of the National Recreation Association. The movement gained momentum under the administration of President Calvin Coolidge with the organization of the National Conference on Outdoor Recreation (NCOR) in 1924.⁵ The Depression of the 1930s further amplified the need to provide more, or improve existing, outdoor recreational opportunities, especially in urban areas. Fortunately, such goals fit nicely into FDR’s New Deal economic programs. Mayor LaGuardia’s success in securing a lion’s share of monies made available by the federal WPA, and Moses’ management skills and his ability to attract talented designers and engineers to his staff, resulted in profound physical changes to the environment of New York City. The construction and renovation of neighborhood recreation areas, such as pools and playgrounds, were some of the most ambitious and successful programs undertaken by Moses with funds largely provided by the WPA.

Moses began to assess the state of the city’s parks and to plan for their future as soon as LaGuardia announced his intention to appoint Moses as Parks Commissioner. According to one source: “Immediately after the election he wrote out, on a single piece of paper, a plan for putting 80,000 men to work on 1,700 relief projects.”⁶ Moses hired a consulting engineer and three assistant engineers to survey every park and parkway in the city. The survey was completed by the time he took office in mid-January 1934.

When Moses took over the Parks Department, it was already employing 69,000 relief workers funded mainly by the federal Civil Works Administration (CWA) and the Temporary Emergency Relief Administration (TERA). However, Moses found the men to be ill-equipped and inadequately supervised, and considered many of the construction projects to have been poorly designed. He immediately began to revamp

the entire operation of the Parks Department and established a Division of Design, located at the Arsenal in Central Park. The staff was to be headed up by experienced professionals drawn mainly from his State agencies. Some of his talented staff of young architects, landscape architects, and engineers, had worked on the designs for Long Island's highly acclaimed parks, including Jones Beach, which is considered one of Moses' greatest accomplishments. His staff also included a number of well-known and accomplished designers, among them architects Aymar Embury II and John M. Hatton, and the landscape architect and civil engineer Gilmore D. Clarke. Other top members of Moses' staff were the landscape architect Allyn R. Jennings, and civil engineers W. Earle Andrews and William H. Latham.

The Parks Department's Division of Design was organized in the following manner: a topographical unit of about 400 surveyors and draftsmen, a landscape architecture unit of about 60 people, an architecture unit made up of 60 architects and draftsmen, and an engineering unit of about 50. Smaller units included an Arboricultural Department and an Inspection Department. All the work in the Division of Design was under the direct supervision of the Park Engineer, who was aided and advised by a Consulting Architect, a Consulting Landscape Architect, and a Consulting Engineer.⁷ All new projects began in the topographical unit, where a complete survey of the land was prepared. It then moved on to the landscaping unit, where the basic concept for the design was developed. Next, the three units: landscape, architecture, and engineering, collaborated to produce the final design and all the necessary construction documents. The Park Engineer and his aides had to approve all of the plans. Moses himself sometimes stepped in to revise or overrule a design, especially on the larger, more visible projects.

Moses' superior management ability and political savvy allowed him to move projects along very quickly and to produce concrete results, gaining for him much public admiration. However, Moses' personal demeanor was notoriously stubborn and arrogant, and he was known, at times, to disregard the legitimate authority of other governmental agencies. Once, when the Department of Plant and Structures refused to suspend a ferry service that used a terminal in the path of constructing the Triborough Bridge approach road, Moses had his men demolish the terminal while the boat was on the other side of the river. He feuded with President Franklin D. Roosevelt for years, even while Washington was pouring millions of dollars into Moses' own Parks Department. His later battles with and subsequent triumphs over community groups opposed to the routing of the Gowanus and the Cross-Bronx Expressways through their neighborhoods are now legendary. Moses was also known to have been insensitive to people of color, and reputedly tried to restrict access to many of his recreational facilities, including the WPA-era pools.⁸

To many, Robert Moses was a master builder; to others he was a spoiled bully who seemingly always had his way. In the summer of 1934, however, Moses was a hero. Hundreds of projects, covering virtually every neighborhood in the city, had been completed. Structures were repainted, tennis courts resurfaced, and lawns reseeded. Hundreds of new construction projects were either already underway or in the process of being designed.⁹ Among them was the Crotona Play Center in the Bronx.

History of Swimming in New York City¹⁰

The Hudson and East Rivers lining the shores of Manhattan both served as popular bathing spots dating to the Colonial era. Despite extensive contamination resulting from decades of unchecked pollution, the long tradition of swimming in New York City's rivers was still strong at the middle of the 19th century. Out of concern for the health and welfare of the people of the city, and particularly of immigrant populations who took most advantage of the rivers, the city opened its first floating pools in 1870. The floating pools, however, were essentially wood-framed structures suspended on pontoons, filled with the same unfiltered river water. By the turn of the century, there were about two dozen of these floating pools moored at various places along the waterfront, competing directly with industry for the space. Some improvements were eventually made to the floating pool concept, e.g. by 1914 the pools were required to be watertight and filled with purified water. Nonetheless, as river quality continued to erode, and access to nearby beaches improved, the floating pools gradually disappeared.

In the 1890s, New York City's first public bath was opened on the Lower East Side of Manhattan by the Association for Improving the Condition of the Poor, following an 1895 state law requiring the construction of such facilities in cities with populations of 50,000 or more. By 1911, twelve new bath houses had been constructed in Manhattan, mostly sited within immigrant neighborhoods. The pool-like indoor baths, however, were never very popular with the working class, and many of the bath houses eventually added actual swimming pools and gymnasias in hopes of attracting more patrons. The indoor pools at the bath houses never

quite replaced the need or demand for outdoor swimming facilities in the city, and by the 1930s, it was clear that they had not aged well.

When Robert Moses became Parks Commissioner in 1934, only two outdoor pools remained, one at Betsy Head in Brownsville, Brooklyn, and the other at Faber Park on Staten Island. Moses, however, considered the Betsy Head pool “unsanitary” and often lamented its “unattractive, inadequate, and impractical bath house.”¹¹ Moses, a strong believer in the need for safe bathing in the city, consulted with the heads of the New York City Health and Sanitation Department in July 1934. Finding that only an increase in the number of swimming pools could ease the existing burden, Moses wrote the following in a press release picked up by the *New York Times*:

“It is no exaggeration to say that the health, happiness, efficiency and orderliness of a large number of the city’s residents, especially in the summer months, are tremendously affected by the presence or absence of adequate swimming and bathing facilities. We are providing additional wading pools for children as fast as we can... This, however, does not meet the problem of any but small children... It is one of the tragedies of New York life, and a monument to past indifference, waste, selfishness and stupid planning, that the magnificent natural boundary waters of the city have been in large measure destroyed for recreational purposes by haphazard industrial and commercial developments, and by pollution through sewage, trade and other waste... We must frankly recognize the conditions as they are and make our plans accordingly.”¹²

To Moses, a forerunner in the national recreation movement and an avid swimmer since his university days, a change was desperately needed, and by October 1934, excavations had already begun for the first of eleven state-of-the-art swimming pools. The pools were to be sited near inner-city neighborhoods in order to provide swimming for those who could not easily reach places like Orchard Beach or the beaches of Long Island. In addition to swimming pools, the new centers would incorporate elaborate bath houses, and also provide active adult sport areas, children’s playgrounds, and other amenities. The eleven pools opened in the summer of 1936 and quickly gained recognition as being among the most exceptional public facilities constructed in the country.¹³ All of the pools featured new bath houses, with the exception of Hamilton Fish and Betsy Head.¹⁴ After the completion of the WPA-era pool complexes, no new public swimming pools were constructed in New York City until the 1970s. Over 1.65 million bathers are thought to have used the new swimming pools in their first summer of use.

The Swimming Pools, Moses, and Segregation in New York City¹⁵

Institutionalized racism was still an established way of life in the United States during the inter-war years, even on the federally sanctioned level. For example, as a result of federal guidelines articulated in the 1935 Federal Housing Administration Underwriting Manual, it was impossible for non-segregated developments to attain mortgage insurance, meaning ethnic and even religious minorities could only secure mortgages in certain areas. The result was a substantial increase in both racial segregation and urban disinvestment in cities across the country, New York included. At its peak, estimates of segregation in public housing nation-wide ran as high as 90 percent due in large part to both federal and local government policies.¹⁶ Even as late as 1943, the City of New York gave its approval for Metropolitan Life’s all-white, middle income project – Stuyvesant Town and Peter Cooper Village.

Robert Moses himself was well known to have been insensitive to people of color. This attitude towards minorities probably had an impact on the both the siting and administration of the WPA-era pools.¹⁷ LaGuardia and Moses often went to great lengths to show the media that they did care about minorities, holding, for example, a celebration for 25,000 people upon the opening of the Colonial Park (Jackie Robinson) Play Center, at which the mayor offered the facility as proof that his administration was in fact “building and doing things for Harlem.”¹⁸ Although LaGuardia and Moses claimed they were siting pools in the most congested areas of the city, Colonial Park in Harlem remained the only one sited in a predominantly “non-white” neighborhood. Moreover, the Thomas Jefferson Play Center, located in East Harlem (LaGuardia’s old congressional district), was close to Spanish Harlem, where the city’s growing Puerto Rican population was settling. To discourage minority use at this facility, Moses reputedly kept the water heating system turned off, believing that the cold water would not bother Caucasian swimmers, but would somehow deter non-whites.

It has also been alleged that the Parks Department at the time had an active policy of hiring only white lifeguards and attendants in hopes of deterring minority patrons. Whether or not such directives came from Moses himself, the fact remains that the pools were largely segregated at the time of their opening. In the Pulitzer Prize winning novel, *The Power Broker*, Robert Caro writes “one could go to the [Thomas Jefferson] pool on the hottest summer days, when the slums of Negro and Spanish Harlem a few blocks away sweltered in the heat, and not see a single non-Caucasian face.”¹⁹ Similarly, oral histories relating to Betsy Head pool tell of an unwritten rule that “African-Americans could swim in the Brooklyn pool only in the late afternoon, after white residents had vacated the premises.”²⁰ Such claims are supported by photographs and video footage from the era, showing that, largely, white and black New Yorkers swam in different pools.²¹ For a handful of sites, however, including the Highbridge and Colonial Park Play Centers in Manhattan, as well as McCarren Play Center in Brooklyn, photographs and video footage seem to indicate that, on occasion, the populations did mix.

The Design and Construction of the Crotona Play Center²²

The Crotona Play Center is one of a group of eleven immense outdoor swimming pools opened in the summer of 1936 in a series of grand ceremonies presided over by Mayor Fiorello LaGuardia and Parks Commissioner Robert Moses. All of the pools were constructed largely with funding provided by the Works Progress Administration (WPA), one of many New Deal agencies created in the 1930s to address the Great Depression. Designed to accommodate a total of 49,000 users simultaneously at locations scattered throughout New York City’s five boroughs, the new pool complexes quickly gained recognition as being among the most remarkable public facilities ever constructed in the country. The city’s pool construction program was reported to have been the most expensive in terms of total cost. Robert Moses, an avid swimmer who had a home near the ocean in Babylon, Long Island, was known to have taken a special interest in the design and construction of bathing and swimming facilities, such as Jones Beach, Orchard Beach and Riis Park, as well as the neighborhood swimming pools.²³ As a result of his special attention, along with that of Aymar Embury II and Gilmore D. Clarke, the design and execution of New York City’s aquatic facilities in the 1930s were a cut above most other park projects at the time.

At the start, the Parks Department adopted a list of shared guidelines for the entire pool project in order to enhance the efficiency of the design effort, to unify the operations of each complex, and to meet the various local and federal requirements of the relief programs. For example, each pool complex was to have separate swimming, diving and wading pools, and a large bath house, the locker room sections of which doubled as gymnasiums during non-swimming months. The bath houses, which would serve as the centerpieces of each complex, would be distinctive pavilions that would establish the design motif of each facility. Concrete bleachers at the perimeter of the pools would furnish spectator viewing areas to be augmented at some sites with rooftop promenades and galleries. There would be a minimum width for the decks to provide enough room for sunbathing and circulation. There had to be underwater lighting for night swimming, and at least one dimension of each swimming pool would have to be a multiple of fifty-five yards to allow swimming competitions to be held at standard distances in either English or metric systems. Plus, the complexes had to share low-cost building materials, principally brick and cast concrete, as required by the federal government as per the terms of the WPA funding.

To satisfy federal stipulations on low-cost materials, it appears that the design team for the pools determined that the streamlined and curvilinear forms of the Art Moderne and Modern Classical styles would best meet the low-cost needs and still permit pleasing aesthetics. As a group, the pools were also distinguished by the innovative mechanical systems required to heat, filter, and circulate the vast amounts of water they used. Many of these innovations set new standards for swimming pool construction, such as scum gutters that allowed in enough sunlight to naturally kill off bacteria and a series of footbaths filled with foot cleaning solution through which bathers were forced to pass upon entering the pool areas from the locker rooms.

Sited in existing older parks or built on other city-owned land subsequently developed as parks and playgrounds, the huge pool complexes were provided with landscape settings that included additional recreational areas, connecting pathway systems, and comfort stations. Despite the fact that the basic components were essentially the same and that the WPA required that only the cheapest materials be used, each of these swimming pool complexes is especially notable for its distinctive and unique setting, appearance, and character.

In October 1934, the Parks Department announced the start of excavations and site work for several of the new pools. By the summer of 1935, a rectangular wading pool to the north of the Crotona Play Center bath house, measuring 110 feet by 110 feet, had already opened to the public. Plans for the brick bath house

structure, with its monumental entrance gateway along Fulton Avenue and its accommodations for 4,265 bathers, were filed in August 1935, noting an estimated cost of \$563,000. Plans for the one-story filter house were also filed at that time, noting an estimated cost of \$230,000.

The year 1936 was known as “the swimming pool year,” since ten of the eleven pools were opened that summer, one per week for ten weeks.²⁴ Each opening day was a memorable event for its neighborhood. The day-long events featured parades, blessings of the waters, swimming races, diving competitions, appearances by Olympic stars, and performances by swimming clowns. Mayor LaGuardia attended every opening to perform the ribbon cutting. Festivities continued well after dusk with LaGuardia pulling the switch to turn on each pool’s spectacular underwater lighting to the “oooohs” of the crowds. The Crotona Play Center opened on July 24, 1936, the seventh of the WPA-pools to open that summer, and the only one of the pools that was sited in the Bronx.²⁵ The main swimming pool measured 330 feet long by 125 feet wide, and required, by some accounts, more than a million gallons to fill.

Five-thousand people attended the Friday evening opening of the Crotona Play Center. The *New York Times* reported that an additional 10,000 hopeful entrants had to be turned away.²⁶ At one point during the evening, Bronx Borough President James Lyons jokingly suggested a race between himself, the Mayor, and Moses, making an indirect reference to the incident which had occurred earlier in the week, during which the Mayor ordered Moses be restrained by police from demolishing a municipal ferry terminal. Lyons was quoted as having said:

“...In such a race, we would have to remember that the Parks Commissioner is something of a speed demon. At times it even takes the Police Department to stop him from speeding ahead with what he considers his civic duty...”²⁷

Since its opening, the completed Crotona Play Center has been considered one of the great WPA Art Moderne structures of the Depression era in New York. Featuring compulsory footbaths and one of the most advanced water filtrations systems of its time, the Crotona Play Center was also considered the pinnacle of technological modernity. The monumental two-towered geometric design of the main entrance, set high above the street level, has a striking presence on Fulton Avenue, while the open-air entrance courtyard, lined with its whimsical brick railings repeating the half-circle patterning employed elsewhere on the facade, grants the swimming complex a true sense of place. The repeated motifs of arched bays flanked by box-like pavilions on the facades of the Play Center bath house and filter house help create a cohesive unit from the disparate elements comprising the landmark site. Together with the other WPA-era park improvements, the Crotona Play Center complex was clearly a major achievement of the New Deal in New York City.

The Designers Behind the Planning of the Crotona Play Center²⁸

The eleven WPA-era pool facilities shared many common features and specifications that could be repeated at each site, and contained other elements that were similar from complex to complex. As a result, junior designers, having different areas of expertise, appear to have moved quickly among the various pool projects. The department produced designs and construction documents simultaneously with great speed so that eleven pools and hundreds of other park projects, including some massive undertakings like Orchard Beach, were completed within a few years. Aymar Embury II and Gilmore D. Clarke, respectively the Parks Department's Consulting Architect and Consulting Landscape Architect, were employed by the city on a part-time basis to oversee designs for park projects under Robert Moses. William H. Latham, the head of the Division of Design at the time, was the Park Engineer, responsible for the preparation of all plans and specifications within the department. Major design problems were discussed by Embury and Clarke before the preliminary sketches were made under Latham's direction. Completed sketches were subject to approval by the Park Engineer, the General Superintendent, and Commissioner Moses. The consultants would give regular criticism during the preparations of the plans.

Aymar Embury II (1880-1966) was born in New York City and studied engineering at Princeton University, where he received a Master of Science degree in 1901. He acquired his architectural training through apprenticeships with three New York firms: George B. Post, Howells and Stokes, and Palmer and Hornbostel. He also worked for Cass Gilbert. In 1905, Embury won both first and second prize in a contest held by the Garden City Company for a modest country house to be built in Garden City, Long Island. This gained for him a reputation as a talented designer and led to many commissions for country houses in the New York metropolitan area. He subsequently published seven books and several pamphlets, mainly on early American architecture,

establishing him as an authority on that subject. By the start of the Great Depression, he was well-known and had received a wide range of commissions all over the east coast of the United States, including college buildings and social clubs, in addition to residences. He designed the Players and Nassau Clubs in Princeton, New Jersey, the Princeton Club in New York City, and the University Club in Washington, D.C. Embury was said to have supervised the design of over 600 public projects, including Orchard Beach, Bryant Park, the New York City Building at the 1939 World's Fair, the Donnell Branch of the New York Public Library, the Hofstra University Campus, the Central Park and Prospect Park Zoos, Jacob Riis Park, five of the eleven neighborhood pool and play centers,²⁹ the Lincoln Tunnel, the Triborough Bridge, and many more.

The lead architect for each pool project generally designed the bath house, which was unique to each site, establishing the motif that guided the design and detailing of the rest of the complex. Although each pool complex has been credited to a particular architect, the designs appear to actually have been collaborative efforts among the army of architects, draftsmen, engineers, and landscape architects employed by the Parks Department in the 1930s.

The design of the Crotona Play Center is most commonly attributed to Herbert Magoon, a young staff member who Moses had previously hand picked to design the bath houses at Jones Beach, which opened in 1929. Frustrated with the unimaginative designs submitted by famous architects for the Jones Beach bath houses, Moses was appreciative of Magoon's austere, but nicely detailed proposals. The design of the bath house at Sunset Park, which opened only four days before the Crotona Play Center, is also attributed to Magoon. Born in Milton, Wisconsin in 1898, Magoon graduated with a Bachelor of Science in Architecture from the University of Minnesota in 1924, after which he was employed by the firm B.G. Goodhue Associates from 1924 to 1928. After his tenure at the New York City Parks Department during the 1930s, Magoon started two firms of his own, Magoon & Barone and Magoon & Salo. By 1962, it appears that Magoon had relocated to Los Angeles, where he was employed as a project architect for William Woollett.

Although Magoon is widely accepted as the designer of the Crotona Play Center, the majority of the architectural plans and construction drawings on file at Olmsted Center Archives in Queens for the bath house and filter house were prepared by Joseph L. Hautman, while those on file for the pool deck area, including the diving pool and the bleachers, were prepared by Harry Ahrens. Hautman was born in Cincinnati in 1903, attended the University of Cincinnati from 1922 to 1923, received his degree in architecture from MIT in 1926, and later studied at the Atelier Gromort Ecole de Beaux Art in Paris from 1927 to 1928. Between 1933 and 1936, Hautman was "Chief of Architecture" for the Parks Department, and served as assistant to the Chairman of the Board of Designs for the New York Worlds Fair of 1939. Hautman joined the already established firm of Voorhees, Smith, Smith & Haines in 1942, where he remained an architect at least through the 1960s. Ahrens was born in New York City in 1896, received his degree in architecture from Columbia University in 1916, was "Architect in Chief" with the New York City Parks Department from 1936 until 1941, and a project manager with Skidmore, Owings & Merrill from 1942 until 1946. By 1962, it appears as though Ahrens had relocated to Philadelphia. William H. Latham is noted as the supervising engineer on many of the drawings for the bath house, filter house, and pool deck areas, while an assortment of other names appear on the drawings as well.

Gilmore D. Clarke, to an unknown degree, was directly involved with the landscape design of the Crotona Play Center, as well as the areas of Crotona Park that surround the complex. While the signature of one A.H. Funnell is found on many of the landscaping drawings, they do often bear Clarke's signature of approval. Clarke (1892-1982) was born in New York City and studied landscape architecture and civil engineering at Cornell University, from which he received a Bachelor of Science degree in 1913. He served as an engineer in the army during World War I, receiving many citations and decorations, and remained in the Army Reserve Corps until 1939. During the 1920s, he served on several local, state, and federal commissions as landscape architect, including the Architectural Advisory Board for the United States Capital, the New York State Council of Parks (which was headed by Robert Moses), and the Westchester County Park Commission, among many others. For his work in Westchester County, which included the Rye Beach Playland, the Saw Mill River Parkway, and the Bronx River Parkway, Clarke was awarded the Gold Medal of Honor in Landscape Architecture from the Architectural League of New York in 1931. By the time of the Great Depression, Clarke was already established as the most popular landscape architect in public works in America.

Clarke's career advanced during the 1930s. Besides being hired by Robert Moses as the Consulting Landscape Architect to the New York City Parks Department, he also became a member of the National Commission on Fine Arts, the New York State Planning Council, and the Board of Design for the 1939 New York World's Fair. In addition to Astoria Park, his work for the Parks Department included Bryant Park, Central Park

Zoo, City Hall Park, Orchard Beach in the Bronx, and the Henry Hudson Parkway. He taught landscape architecture at Cornell University from 1935 to 1950, serving as dean from 1939 until his retirement in 1950, and wrote several articles for trade periodicals. In 1935, Clarke joined Michael Rapuano, an engineer and landscape architect, establishing the New York civil engineering and landscape architectural firm Clarke & Rapuano, Inc. Clarke was president of the firm from 1962 until his retirement in 1972. Later in his career, Clarke worked as a consultant on the construction of the United Nations Headquarters in New York and became a Trustee for the American Museum of Natural History.

Frederick G. R. Roth is responsible for the designs of the sculptural elements found throughout the Play Center complex, including the ibis-topped pilasters of the bath house, and the bas-relief roundels located within the seating niches of the pool deck. Roth was born in Brooklyn in 1872 and studied art privately both in Vienna and at the Academy of Fine Arts in Berlin. By the time he completed his studies in 1894, Roth had already begun an active professional career as a sculptor. In 1934, Roth began working as the chief sculptor for the Parks Department through the WPA. In that year, Roth oversaw a team of artisans who carved the limestone reliefs that adorn the animal houses of the new Central Park Zoo. Roth's numerous other commissions can be found throughout the parks and playgrounds of the five boroughs. Roth died in 1944, less than a decade after completion of the Crotona Play Center.

Subsequent History³⁰

The Crotona Play Center officially opened at 8:30 PM on Friday, July 24, 1936, the seventh of the eleven pools to open. A rectangular wading pool located to the north of the bath house was already open at this time, having opened in 1935 as part of Moses' campaign to provide safer bathing options for city residents. Few alterations were made to the Play Center complex in the years immediately following its opening.

In 1960, the Crotona Play Center was the unexpected site of a tragedy when a six-year old boy was found drowned in the main swimming pool. In 1965, already showing signs of its age, the Play Center was slated for reconstructive work as part of a \$6.3 million plan for library, park, and playground projects under the administration of Mayor Robert F. Wagner. In 1966, the swimming pools at Crotona were kept open until midnight, alongside those of Sunset Park, Astoria, Joseph Lyons, and several other pools, offering an escape from a particularly stifling heat wave. During the winter of 1971, a group of vandals stripped the Play Center of thousands of dollars worth of piping, valves, and electrical fixtures, striking the play center at Thomas Jefferson as well - the first such incidents of their kind. Ultimately, it cost the city between \$25,000 and \$70,000 in supplies and took nearly 40 men working daily to repair the pool. All of the bath house and filter house windows were filled in at this time to lessen the likelihood of a repeat incident. For the Parks Department, however, reopening the pool remained a priority, as decades after its initial opening, with New York's boundary waters and oceans more polluted than ever, people continued to rely on the urban oasis for relief from the summer's heat.

By the late 1970s, many of the WPA-era pools, Crotona included, had become badly run down, partially the result of the fiscal crisis of the 1970s which hit the Parks Department particularly hard, and which affected the neighborhood surrounding Crotona Park as well. In 1977, the Parks Department began a capital restoration project to restore the pools. The 1978 Parks Department capital budget, however, was a mere \$6.7 million, and by March 1981, the department's workforce had dwindled to a record low of 2,900 employees, mostly unskilled and temporary, as compared to the 30,000 Parks employees on staff during the Moses administration. The strain on Parks Department resources was evident in the conditions of many of its facilities.

The WPA-era pools faced a new set of challenges beginning in the mid-1980s, with pools like the Crotona Play Center in the Bronx becoming infamous for vandalism and walkways littered with broken glass. Moreover, Crotona Park had acquired a reputation of being a dangerous place frequented by drug addicts. In 1982, the Parks Department capital construction program swelled, allowing for one of the largest capital expenditures since the days when Moses was Parks Commissioner. By the fiscal year's end in 1982, the Parks Department had spent \$76 million on projects that included the sprucing up of neighborhood parks, playgrounds, and ball fields, a \$1.3 million rehabilitation of Belvedere Castle in Central Park, renovation of the Coney Island Boardwalk, and the rebuilding of the sea wall along the Shore Parkway in Brooklyn. More than \$100 million in additional capital improvements was expected for the 1983 fiscal year, which would be used

for the rehabilitation of the Crotona Play Center, among other city pools. The Crotona Play Center was closed throughout the summers of 1982 and 1983 while the restoration efforts were underway.

The newly renovated Crotona Play Center was re-opened on August 2, 1984, to the great relief of neighborhood residents. The \$6 million restoration, which included improvements to Crotona Park as well, restored the pool complex to its original appearance. The numerous improvements included the replacement in kind or with appropriate substitution materials of deteriorated or missing architectural elements, the installation of a new roof, windows, electrical systems, lockers, showers, water fountains, a new wrought iron fence around the perimeter of the pool, and a new automatic filtration system. All of the Play Center facilities, including the entrance, pool ramp, toilets, and locker facilities, were made handicap accessible. Graffiti was also removed from both the interior and the exterior of the building, while all surfaces were newly painted, and the artwork surrounding the pool cleaned up. The existing ticket window was removed and a new booth constructed along the south wall of the entrance courtyard. During the rededication ceremony, Mayor Edward I. Koch declared, "...so extensive has the restoration been that we can say this is a brand-new facility;" Koch also cited the pool as an example of what people meant when they would say "the Bronx is coming back," before shedding his clothes to reveal a pair of swimming trunks, and joining nearly 200 children for an inaugural swim.³¹

Financial troubles continued to plague the Parks Department, and in 1991, Mayor David Dinkins proposed closing the pools as part of a package of budget cuts. Only a donation of \$2 million from a private donor, real estate magnate Sol Goldman, guaranteed the pools would be kept open for at least a portion of that summer; an additional \$1.8 million was still needed to cover the entire nine-week long swimming season. In the mid-1990s, a menacing ritual known as "whirlpooling" had become common throughout the pool system, a practice characterized by groups of teenage boys locking arms and shoulders, churning the water and disrupting the activities of other swimmers, particularly women who often found themselves unwillingly fondled. In 1993, a 17-year old boy was arrested for molesting a 14 year-old girl at the Crotona pool. Several similar complaints of sexual assault were recorded throughout the pool system in the summer of 1994. With improvements in security staffing and increased vigilance on the part of patrons, many of the problems of the 1990s did eventually dissipate, and by 2003, the pools were once again touted as both extremely safe, and a welcome alternative on a hot summer day.

Subsequent changes to the complex included the filling-in of the diving pool (1995) and the alteration of the rectangular wading pool into a hexagonal-shaped wading pool that was later filled in (post-1980s). In 1996, the former wading pool area, which was renamed the Bathgate Playground, underwent \$1 million in renovations under the administration of Mayor Giuliani, during which swings, play equipment, safety surfacing, wrought iron fencing, and the asphalt pathways were added to the area. Also added as part of the 1996 renovations of the former wading pool area were the three freestanding sprinklers modeled on the original Roth-designed ibis sculptures. Today, the playground is in constant use by children from a nearby charter school, while neighborhood residents enjoy the "Puppets in the Park" show that is presented at the renovated facility each year.

The Architecture and Site of the Crotona Play Center

The New Deal construction projects within New York City, such as the Crotona Play Center, were a part of a national trend that included similar projects undertaken by various governmental agencies, ranging from the vast Tennessee Valley Authority to small cities and towns. Urban projects built with WPA funding often possessed similar qualities from region to region, partly because the difficult economic climate dictated the use of inexpensive building materials, but also because the programs provided employment opportunities for a generation of young architects and engineers, many of whom were committed to modernism. For example, the bath house and waterfront facilities at Aquatic Park in San Francisco are similar in plan and appearance to the public pool and beachfront projects being built at about the same time in New York City. The California facility, with its streamlined, concrete facade and steel-framed windows, bears a striking resemblance to the facade added in 1936 with WPA funds to the bath house at Jacob Riis Park in Queens. The original and creative use made of these modest materials by Moses' talented design teams and the careful siting of each project makes every one of them a distinguished, individual design, as much related to their specific environment and needs as to one another.

Set amidst the rock outcroppings characteristic of Crotona Park, the Crotona Play Center is considered one of the great WPA Art Moderne structures of the Depression era in New York. The main entrance, a

towered monumental arched gateway composed of robust geometric forms, is reached from Fulton Avenue by way of an imposing stairway. The entry courtyard features a second-story gallery edged by a decorative brick railing that repeats the half-circle patterning employed for the balconies on the gateway facade. Quarter-round cast-concrete buttresses and arched clerestory windows are notable features of the exterior of the locker room sections of the bath house. The main entrance to the pools from the bath house is distinguished by the decorative brickwork of its segmental arch, and by the ibis-topped center post designed by Frederick G. R. Roth. The bas-relief roundels depicting humorous swimming-related subjects on the rear walls of the seating niches along the eastern edge of the pool complex, also sculpted by Roth, further illustrate the close relationship of fine art and architecture in the WPA-era pools. The decorative arched openings and buttresses of the adjoining filter house reiterate some of the forms utilized for the bath house. The elevated terrace once occupied by a large wading pool on the south side of the bath house is now used as a children's playground.

Description

Plan and Circulation

The Crotona Play Center is bounded roughly by 174th Street to the north, 172nd Street to the south, Fulton Avenue to the west, and Crotona Park to the east. Due to the rocky character of Crotona Park and the presence of a naturally hilly landscape, the Play Center complex is located above grade, accessible via the stairs of the main entrance along Fulton Avenue at 173rd Street. Both the bath house and pool deck can be accessed through this main entrance, as well as via additional entry points along the boundary walls of the pool deck area. Gauged brick archways beneath the north and south towers of the main entrance offer access to additional areas of the bath house, including offices lining the second story gallery of the entrance courtyard, and a small rooftop viewing area above the first aid building to the south.³² Entry to the bath house is also possible from the pool deck, as well as from the former wading pool area to the north (now Bathgate Playground).

Upon ascending the main entrance stairway and passing beneath the soaring brick archway of the bath house west facade, patrons of the Crotona Play Center will find themselves in an open-air entrance courtyard. Originally, admission tickets to the Play Center complex were purchased at a ticket booth located along the rear (east) wall of the entrance courtyard.³³ Patrons would then be led through one of two gauged brick archways on either side of the ticket booth to the men's and women's locker rooms. After changing into swimsuits and storing clothes and valuables with clerks in the available basket space, male and female patrons would pass from the mirror-image locker rooms, through the mandatory shower rooms, past the required footbaths, and finally under the ibis-topped archway of the bath house south facade, before arriving on the pool deck.³⁴ The two pools found here, the main swimming and former diving pools, are surrounded by ample promenades, an expanse of concrete bleachers, and a series of seating niches.

Like the Play Center bath house, the former wading pool area is similarly located above grade, accessible via staircase at Fulton Avenue just north of 173rd Street. Entry to the former wading pool area is also possible from pedestrian pathways within Crotona Park to the north and to the east. The former wading pool was rectangular in plan, surrounded on all sides by an ample promenade lined with trees and benches. The filled-in wading pool area is currently used as a children's playground. Access to the bath house facilities, including a women's bathroom, and originally a boy's bathroom, is possible from the former wading pool area.

An extensive network of pedestrian pathways is found throughout Crotona Park. Laid to complement the natural topography of the park, the pedestrian pathway that forms the eastern boundary of the designated landmark site follows a curved trajectory before joining the pedestrian pathways to the north and to the south of the Play Center complex.

The Bath House

The design of the Crotona Play Center bath house is particularly striking due to its position high above the grade of Fulton Avenue. At the top of the granite staircase of the main entrance, two towers rise from the robust geometric forms of the north and south entry pavilions, united by a soaring brick archway marked with the words "CROTONA PLAY CENTER" in bronze lettering.³⁵ The first four risers of the granite staircase extend beyond, and curve in a quarter-round to meet, the massive rectangular sidewalls of the stairway. As is typical for all of the Play Center's brick surfaces, the sidewalls are laid in a modified English bond of header courses

separated by two stretcher courses and capped with cast stone coping. A brick-paved landing laid in a basket weave pattern and edged with granite block meet patrons at the fourth riser.³⁶

The north and south entry pavilions, located at the top of the main stairway, are nearly identical. On the west facade, each pavilion features a segmental gauged brick arched opening at the second story, distinguished by a decorative brick balconette railing in a half-circle patterning with cast stone coping and a cast stone base. At the first story, the north pavilion features a segmental gauged brick arched window opening with a flush cast stone sill that is narrower than the second-story balconette. The south entry pavilion differs with a full-height opening that is similar in width to the second-story balconette, but also features a segmental gauged brick arch.³⁷ The rooflines of both the north and south pavilions are lined with cast stone coping.³⁸

Geometric towers, rectangular in plan, rise out of the north and south entry pavilions of the Play Center. Each features a brick corbel that begins flush with the tower just above the second-story roofline of the pavilions and cants outwards until the point at which it is capped by a matching cast stone detail. This feature is repeated on the four sides of each tower, with slightly wider corbels and cast stone details on the north and south faces. Spanning between the cast stone details and above the cast stone coping of each tower are two horizontal cast stone fins resembling floating louvers. Two bronze clocks, which are currently missing hands, hang from the exterior-facing facades of each tower at roughly the height of the cast stone fins.³⁹ Above the fins, each tower is capped with a rectangular glass block enclosure that is several feet in height.⁴⁰ The archway of the main entrance to the Play Center spans between the two towers and is capped by a thick cast stone band featuring three semicircular details at its center.⁴¹ The curved underside of the arch features brickwork laid in an intricate herringbone pattern set within a slightly recessed panel. Three diamond-shaped cutouts centered under the arch originally lit the entranceway.

The open-air courtyard at the top of the main entrance stairway repeats many of the same motifs found on the west facade of the main entrance. Directly beneath the archway of the main entrance, on the interior-facing walls of the north and south tower, flat arched openings at the first-story feature stepped brick corbels and support second-story balconettes with the same half-circle patterning and cast stone details found on the west facade.⁴² Recessed pilasters featuring decorative brickwork help support the segmental gauged brick arches of the second-story openings. At the base of the north tower, to the right, a cast stone cornerstone reads "AD 1936." A soldier course of brick lines each brick face of the entrance courtyard, at both the first and second stories, stopping shy of each corner where they would otherwise meet. The brick paving of the courtyard area is laid in a basket weave.

The rear (east) wall of the entrance courtyard is characterized by a wide, flat arched opening at its center, which contained the original ticket booth for the complex, and which is flanked on either side by the segmental gauged brick archways that lead to the men's and women's locker rooms.⁴³ The northern and southern walls of the entrance courtyard are a mirror image of each other and feature a full-width segmental gauged brick archway leading to the first-story gallery.⁴⁴ A stepped cast stone band lines the galleries between the first and second stories. Overhead, the second-story gallery is edged by a decorative brick railing that repeats the half-circle patterning employed on the balconettes of the main entrance. The railings are capped by cast stone handrails.⁴⁵ Small cast stone posts further subdivide the central span of the rear (east) gallery railing. A series of cast stone capped, rectangular brick columns surround the second-story gallery and support a sloped wooden roof with overhanging eaves. Surrounding the second-story gallery, four office doorways feature flat gauged brick arches. Additional full-height openings on the north and south walls of the second story feature segmental gauged brick arches and either the same balconettes found on the west facade of the main entrance or non-historic wrought iron fencing. In places, damage to the half-circle patterning of the balconette railings has resulted in the loss of some original material.

Beyond the open-air entrance courtyard lies the actual bath house structure. Essentially rectangular in plan, the two longer sides of the bath house run parallel to 173rd and 174th Streets, with the shorter sides parallel to Fulton Avenue. The four facades of the bath house are constructed of brick laid in the typical bond for the site and originally featured cast stone coping, which is currently obscured by metal coping. Both the north and south facades of the bath house are edged by a granite base trim. The rear (east) wall of the entrance courtyard is also the west facade of the bath house structure.

The south facade of the bath house faces the pool deck of the Play Center complex. Segmental gauged brick arches span nine single-story brick pilasters along this facade, subdividing the wall into seven recessed bays. Cast stone blocks and quarter-round buttresses top the seven central pilasters, while cast stone coping

lines each of the bays. Each of the pilasters is further detailed by slightly canted brick edging. Arched clerestory window openings with simple cast stone sills sit atop gently canted brick panels that are further recessed beneath the arches of each bay.⁴⁶ The double door entry to the women's locker room, located beneath the clerestory window of the rightmost (eastern) bay is a later addition.⁴⁷ The recessed second story of the bath house structure is also subdivided into seven bays, demarcated by the quarter-round buttresses. Each of the second-story bays contains two rectangular windows beneath a flat gauged brick arch. The two rectangular louvered vents edging the central bay are original to the bath house structure.

Two imposing box-like pavilions flank the south facade of the bath house to the east and to the west and are distinguished by decorative brickwork and sculptural cast stone details. Each of the pavilions features a recessed central panel containing a vast segmental arch composed of gauged brick and bluestone courses and trimmed by cast stone. Sculpted cast stone pilasters support each of the arches. The central pilaster of the right-hand (eastern) pavilion, which is divided into two bays, is especially notable for the stylized ibis sculpture that sits atop it, designed by sculptor Frederick G. R. Roth. The left-hand (western) pavilion is divided into three uneven bays by two simpler geometric pilasters. The right-hand pavilion features rolling steel doors that lead to the men's and women's shower rooms, situated on either side of the ibis-topped pilaster, and a pair of louvered vents above. Three granite blocks, approximately two-feet in height and three-feet in depth, project outwards from the cast stone pilasters of this pavilion. The left-hand pavilion features rectangular window openings atop recessed concrete panels and a trio of louvered vents above.⁴⁸ Rectangular cast stone blocks sit flush against the facades of each pavilion, a few feet below the roofline, above which the corners of the building are clipped.⁴⁹

Further to the east, the bath house continues at a single-story height, recessed from the main facade. Housing the men's shower room, this portion of the south facade is characterized simply by two flat gauged brick arched window openings and simple cast stone sills. To the west, the bath house continues, similarly, at a single-story height, recessed from the main facade. Housing office space, this portion of the south facade contains only a single flat gauged brick arched window opening with simple cast stone sill.⁵⁰

The north facade of the Crotona Play Center bath house faces the former wading pool area and is a mirror image of the south facade, with a few notable exceptions.⁵¹ The single-story, recessed area to the east of the left-hand (eastern) pavilion of the north facade features an entrance to the women's bathroom and is characterized by a flat gauged brick arched doorway which sits beneath a cast stone band reading "GIRLS" and a rectangular glass transom. A second opening in this wall is comprised of a flat gauged brick arched window opening with flush cast stone sill. In place of rolling steel doors, the ibis-topped, left-hand pavilion of the north facade features two doors, which originally led to a "mother's room" and a "director's office."⁵² A narrow window opening with a flat gauged brick arch with a flush cast stone sill also pierces the wall of the left-hand pavilion.⁵³ Similar narrow window openings are located on either side of the right-hand (western) pavilion. The central bay of the right-hand pavilion originally featured an entrance to the boy's bathroom, but is now filled in with a concrete panel beneath a rectangular window. The single-story recessed area to the west of the right-hand pavilion features a single flat gauged brick arched window opening; the west facade of this area features two similar window openings.⁵⁴

Due to the slope of Crotona Park east of the Play Center complex, much of the east facade of the bath house is not readily visible. A narrow ramped service walkway located between the east facade and the retaining wall of the park, however, makes it possible to view the entire facade at a close distance. This walkway allows for entry into service areas of the bath house at the basement level, as well as entry to the pool deck area to the south, currently closed off by a wrought iron gate. Similar to the north and south facades of the bath house, segmental gauged brick arches span between a series of pilasters along the east facade, subdividing it into six bays that sit high atop the concrete basement wall. Arched clerestory window openings with simple cast stone sills rest similarly above gently canted brick panels that are further recessed beneath the arches of each bay. A double door service entrance is located at the basement level of the third bay from the south (left), while basement-level windows at the first and second bays appear to have been filled in. To the left and right of the series of bays, projecting brick panels mimic the box-like pavilions of the north and south facades. Each projecting panel features a narrow, slightly recessed gauged brick arched window opening with a simple cast stone sill that sits atop gently canted brick panels at a slightly lower height than the clerestory windows of the bays. At the ground level, returns from the granite base trim of the north and south facades are visible.

Pool Deck Area

The pool deck area of the Crotona Play Center is composed of a rectangular main swimming pool and a semicircular former diving pool, located to the south of the bath house structure.⁵⁵ At the northwest corner of the pool deck area, a flat-roofed overpass featuring a brick facade and concrete support beams projects from the south facade of the bath house, connecting the bath house to a building still used as a first aid station, and under which patrons may pass to access the handicap ramp along Fulton Avenue. A single doorway with a flat gauged brick arch pierces the south facade of the bath house beneath the overpass, while a mirror image of this doorway pierces the northern wall of the first aid building.⁵⁶ The pool-facing elevation of the overpass features a massive concrete lintel that is flush with the brick facade. The pool-facing elevation of the first aid building, which sits slightly forward from the overpass, is characterized by a large window opening beneath a flat gauged brick arch with a flush cast stone sill. The Fulton Avenue-facing elevation runs continuously with the west facade of the bath house structure. Cast stone coping and granite base trim run the length of the facades of both the overpass and the first aid building.⁵⁷

Abutting the first aid building to the south is the massive concrete bleachers, which line the main swimming pool to the west and follow continuously along the semicircular curve of the former diving pool until the point of abutment with the south facade of the filter house. The bleachers take the form of exaggerated concrete stairs with a rounded profile. The first riser of the bleachers overhangs the east facade of the first aid building and the west facade of the filter house by approximately one foot. Six staircases can be found along the bleachers, created by tucking smaller concrete risers between the larger bleacher stairs.⁵⁸ One of the staircases abuts the first aid building to the north and originally led to an opening in the otherwise blank south facade that formerly offered access to a rooftop viewing area, now closed off. A narrower staircase to the west of the main swimming pool appears to be solely for ease in climbing the massive bleachers, while the remaining staircases lead to ancillary exits, all of which have been either gated or permanently blocked. The ancillary exits, located to the west of the main swimming pool, are flanked by large rectangular brick piers that are capped by cast stone. A wrought iron fence sits atop the concrete curb that runs along the bleachers, denoting the western and southern boundaries of the pool deck area. Several hexagonal concrete piers located along the top riser of the bleachers may have originally held historic lampposts.

At the northeast corner of the pool deck area is a brick retaining wall that is capped by cast stone and features a soldier course at its base. At a distance of approximately 20 feet south of the rectangular pier at the northern extent of this retaining wall, the wall turns sharply 90-degrees to the west before curving back to the south and continuing along the east side of the pool deck until the point at which it overlaps the west facade of the filter house. A wrought iron fence runs the length of the retaining wall above the cast stone coping, terminating at the point where it abuts the northern facade of the filter house. Recessed within this retaining wall are twelve seating niches separated by massive rectangular brick piers. A streamlined overhanging canopy runs continuously along the length of the twelve niches, featuring rounded ends that extend approximately three feet past the first and last of the seating niches. On the rear walls of each niche are twelve bas-relief roundels depicting humorous swimming-related subjects.⁵⁹ Squat brick piers support wooden benches within each niche. Small cutouts centered over each bench may have originally lit the spaces.⁶⁰

South of the seating niches, to the east of the main swimming pool, sits the filter house, a single-story brick structure that replicates many of the forms and motifs of the bath house. Segmental gauged brick arches span between brick pilasters, subdividing the west facade of the filter house into seven recessed bays. Fluted, rounded cast stone and brick details cap each of the six pilasters, rising more than two feet above the roofline of the filter house, and back a depth of more than five feet. Each of the pilasters is further detailed by slightly canted brick edging. Arched clerestory window openings with simple cast stone sills sit recessed beneath each of the arches, resting above solid concrete bands that were originally obscured by a marquee suspended from tiebacks. The window openings of the first, central, and last bays have been filled in to accommodate non-historic rectangular louvered vents. Beneath the smooth concrete bands run fluted cast stone strips. A series of glass block windows originally sat recessed beneath the fluted strips, but have been replaced by concrete panels.⁶¹ Above a granite base trim, an additional band of granite sits within each bay. A pair of granite blocks featuring a curved profile also sits within each bay, originally supporting a series of wooden benches, none of which remain.⁶²

Similar to the bath house, box-like pavilions flank the west facade of the filter house to the north and to the south. A vast segmental arch composed of gauged brick and bluestone courses spans the recessed area

between the broad pilasters of each pavilion. Recessed beneath the larger arches are gauged brick arches of a considerably shallower depth. Full-height glass block windows sit further recessed beneath the shallower arches.⁶³ Rectangular granite flower boxes with rounded corners, no longer used for this purpose, rest at the base of each glass block window, coming to the same height as the granite base trim of the rest of the filter house.

Further to the south, the filter house continues at a slightly lower height, recessed from the main facade, and featuring a single doorway demarcated by a flat gauged brick archway and a raised granite threshold. To the north, the filter house steps back twice, as well as twice down in height. The portion of the facade just north of the left-hand (northern) pavilion of the filter house features a pair of non-historic double doors beneath a rectangular transom, on a raised granite threshold.⁶⁴

The south facade of the filter house abuts the massive concrete bleachers of the pool deck area. The eastern two-thirds of the facade is recessed slightly from the rest of the facade and features a single, semicircular gauged brick opening above a flush cast stone lintel. Although currently filled in with concrete, the opening originally contained a semicircular casement window with moveable sash.⁶⁵ The north facade of the filter house is essentially a blank brick wall laid, as the rest of the filter house, in the typical bond for the site. The four facades of the filter house retain their original cast stone coping.⁶⁶

The east facade of the filter house, which is not visible from the pool deck area, is largely obscured from view by fencing and vegetation within Crotona Park. Each of the facade's nine bays features a recessed brick panel flanked by shallow brick pilasters. Originally centered within each bay were nine round casement windows with hinged bottom sashes.⁶⁷ Due to the slope of Crotona Park and the presence of a large service entry, only the basement and first stories of the first three bays can be readily observed. The windows of these bays were placed slightly higher on the facade than the windows of the other bays, while the granite base trim that runs along the facade to the north here becomes a band that separates the basement from the first story. The second bay from the left (south) features a double door service entry at the basement level, and its original portal window has apparently been replaced by a rectangular louvered vent. Beginning at the left pilaster that flanks the second bay, a concrete ledge protrudes from the granite trim, below which the brick facade juts out approximately one foot from the rest of the facade. Further to the south, the basement level of the filter house is recessed back from the main facade and continues as the foundation of the pool deck area bleachers.⁶⁸ The east facade of the filter house retains its original cast stone coping.

Evenly spaced along the west promenade of the pool deck are eight non-historic lampposts. Five non-historic lampposts line the promenade to the east of the main swimming pool as well as the semicircular promenade surrounding the former diving pool, while an additional two lining the promenade between the main swimming and former diving pools. A possibly historic flagpole sits between the main swimming and former diving pools, where the diving boards were once located. Lining the main swimming pool to the north and to the east, as well as the former diving pool area, are several non-historic metal guard rails. The main swimming pool has also been made handicap accessible by means of a ramp and railing at the northwest corner. Two hexagonal, conical filters sit in their original positions, centered within the main swimming pool. Three water fountains can be found on the pool deck area - in front of the first aid building, by the curved retaining wall, as well as by the former diving pool. Currently a chain-link fence separates the areas of the pool deck containing the main swimming and former diving pools.

Former Wading Pool Area

Located along Fulton Avenue between 173rd and 174th Streets, the former wading pool area of the Crotona Play Center complex is bounded by non-historic pedestrian pathways to the north and to the east, the bath house to the south, and a series of low-rising brick retaining walls to the west. The southernmost retaining wall, which abuts the north facade of the bath house, runs northwards along the western boundary of the former wading pool area, turning 90-degrees to the west at the point where it becomes the northern wall of the service building along Fulton Avenue. A foot-high concrete curb continues along the western boundary of the former wading pool area until it abuts another retaining wall south of the staircase landing, which in turn becomes the southern sidewall of the former wading pool area entrance stairway. A matching retaining wall to the north breaks for the entrance to the handicap access ramp. The various retaining walls of the former wading pool area are laid in the typical bond for the landmark site and feature granite base trim and cast stone coping, topped with non-historic wrought iron fencing.

Some time before the 1980s, the original rectangular wading pool was altered into a smaller, hexagonal-shaped pool. Although it is unclear when the altered pool was ultimately filled in, a \$1 million renovation project completed in 1996 under the administration of Mayor Rudolph Giuliani is largely responsible for the appearance of the former wading pool area today. The 1996 alterations to the former wading pool area included the addition of swings, play equipment, safety surfacing, wrought iron fencing, and the asphalt pathways that form portions of the northern and eastern boundaries of the wading pool area. Also added as part of the 1996 renovations are the three free-standing sprinklers modeled on the original Roth-designed ibis sculptures found on the north and south facades of the bath house. Other notable features of the former wading pool area are the planted trees, non-historic park benches, water fountains, flag pole, and chess and checker tables. The brick landing at the top of the entrance stairway to the former wading pool area is laid in a herringbone pattern. A granite plaque inset identifying the area, known today as Bathgate Playground, is set with the herringbone landing at the top of the staircase.

The Surrounding Park

The entrance stairway to the former wading pool area is located along Fulton Avenue between 173rd and 174th Streets. Like the main entrance stairway to the Play Center complex, the granite stairs of the former wading pool area are flanked by brick sidewalls featuring cast stone coping and granite base trim.⁶⁹ At street level and at the seventh riser, brick landings are paved in herringbone patterns and edged with granite. The sidewalls of the stairway continue as brick retaining walls, curving to the north and to the south of the stairway. To the north, a handicap access ramp was integrated seamlessly into the site as part of the 1996 renovations of the former wading pool area. The design of the handicap access ramp is mimicked by the retaining walls of the enclosed grassy area south of the stairway, including the two square cast stone capped piers that mark the entry to the actual ramp to the north.⁷⁰ The southern end of this retaining wall abuts a similar brick pier at the point where it meets the retaining wall of a freestanding service pavilion. Two curving brick and cast stone capped retaining walls flank either side of the service pavilion, which was likely constructed after 1940. The facade of the service pavilion building features two cast stone capped pilasters between which spans a cast stone beam reading "SERVICE." A pair of double doors sits beneath the beam, while a slightly peaked roof sits above. South of the service pavilion, another brick retaining wall continues southwards, abutting a massive, square cast stone capped pier to the north of the main entrance to the Crotona Play Center. A matching cast stone pier lies to the south of the main entrance as well.⁷¹

South of the pier located to the south of the main entrance, a concrete handicap access ramp with iron handrails was incorporated into the site during the 1984 renovations. Beginning south of the handicap access ramp, and continuing to the southern boundary of the landmark site at the approximate intersection of Fulton Avenue and 172nd Street, a steeply sloped grassy area, characterized by the jagged rock outcroppings typical of the rest of Crotona Park, is enclosed by a low-rising wrought iron fence atop a concrete curb. Two L-shaped ancillary staircases are set into the slope, adjoining the ancillary exits atop the pool deck bleachers to the west of the main swimming pool. Both of the granite ancillary staircases are lined by tall brick and cast stone capped sidewalls featuring brick soldier courses at bases of the interior-facing sides, and granite base trim on the Fulton Avenue-facing elevations. Closer to Fulton Avenue, each staircase features a large brick pier capped with cast stone and featuring granite base trim that originally supported a flagpole. Each of the staircases features two brick landings laid in a herringbone pattern and edged with granite.⁷² Above the sidewall of the left-handed (northern) ancillary staircase, a rough-cut masonry retaining wall is visible along the retaining wall of the pool deck bleachers. To the south, the upper landing of the right-most (southern) ancillary staircase runs continuously into the semicircular pedestrian pathway that lines the southern extent of the former diving pool area. The staircase sidewall also curves continuously along this pathway, descending into the ground until it is ultimately embedded within the hillside.

Approximately 90 feet east of the southeast corner of the filter house, an asphalt pedestrian pathway sinks below grade, forming a forked service entry to the filter house. The massive curved concrete retaining walls of the service entry are covered in a brick veneer that replicates the typical bond of the landmark site. The walls are capped with cast stone and lined with a projecting concrete curb. A chain-link fence runs along the top of the walls. The northern fork of the service entry terminates at a dead end, while the northern retaining wall of the west fork abuts the eastern facade of the filter house. To the south, the wall forms a flat

archway that abuts the eastern facade of the filter house, leading to additional service space. A chain-link gate ultimately blocks the public from access to these service areas of the filter house.

The pedestrian pathways found to the south and to the east of the Play Center complex were originally installed during the WPA-era. The semicircular pedestrian pathway that lines the southern wall of the former diving pool area retains many of its original asphalt hexagonal paving blocks. The rectangular landing that lies south of this pathway, where a freestanding brick concession stand once stood, also retains many of its original hexagonal blocks. A series of metal panels hang from the wrought iron fencing of the former diving pool, and have been painted with scenes of aquatic wildlife by local school children. Several louvered vents encased in concrete boxes are set into the ground along the eastern portion of the retaining wall of the former diving pool area. The vents likely provided ventilation for the service areas of the filter house located beneath the former diving pool bleachers.

To the east of the Play Center complex, a curving pedestrian pathway forms the eastern boundary of the landmark site. Although this pathway was likely originally paved with the same hexagonal blocks found to the south of the former diving pool, it is now paved with asphalt and lined with concrete curbing. The grassy area between this pathway and the eastern boundary of the pool deck area is characterized by the rock outcroppings found elsewhere throughout Crotona Park. An additional pedestrian pathway and stone staircase that intersected with this pedestrian pathway at roughly the northern boundary of the bath house was removed in the 1990s. The asphalt pedestrian pathways that comprise the north and northeastern boundaries of the landmark site are modern. Non-historic lampposts and fencing can be found along the numerous pedestrian pathways and retaining walls of the designated landmark site.

January 7, 1938.

⁴ More than 10,000 of the city's 29,000 manufacturing firms had shut down, and the unemployment rate skyrocketed to over 30 percent. An estimated 1.6 million people in New York City were receiving public assistance. See Caro, p. 323.

⁵ By the 1920s, the recreational needs of people were changing with the increase in leisure time afforded by the advent of shorter work weeks, paid vacations, and greater mobility due to inventions like the car. The addition of active recreation to city parks was in direct keeping with popular theories on the importance of providing the public with outlets for active recreation over passive recreation in these changing times. The Great Depression of the 1930s further amplified such needs.

⁶ Rodgers, p. 82.

⁷ A staff of 1,893 architects, engineers, landscape architects, and technicians, was employed at the peak of the work. See Rodgers, p. 84. Moses later came under fire by a number of city aldermen for hiring people for the Parks Department's technical staff who did not meet the guidelines for relief work. Moses vigorously defended this practice, calling the investigation "Tammany-controlled." *New York Times*, April 10, 1935, p. 1; April 20, 1935, p. 4.

⁸ Work is ongoing as to whether Robert Moses did actively discourage minorities from using Parks Department facilities such as the WPA-era swimming pools. Also see: Caro; Hilary Ballon and Kenneth T. Jackson, eds. *Robert Moses and the Modern City: The Transformation of New York*. New York and London: W.W. Norton & Company, 2007.

⁹ During Moses' first year as Parks Commissioner, the Department spent over \$90 million (\$1.2 billion in 2005 dollars) for work relief projects, most of which was provided by the Federal government. New York City was the largest single recipient of Federal largesse during the course of the New Deal. It has been estimated that the city received one-seventh of the total national outlay. See Rodgers, pp. 84-85.

¹² See "23 Bathing Pools..." p. 17; Moses "Press Release..." July 23, 1934.

¹³ In the order of their inauguration, the eleven WPA-era pools included: Hamilton Fish Play Center (Manhattan), Thomas Jefferson Play Center (Manhattan), Astoria Play Center (Queens), Joseph Lyons (Tompkinsville) Play Center (Staten Island), Highbridge Play Center (Manhattan), Sunset Play Center (Brooklyn), Crotona Play Center (Bronx), McCarren Play Center (Brooklyn), Betsy Head Play Center (Brooklyn), Jackie Robinson (Colonial Park) Play Center (Manhattan), and Red Hook Play Center (Brooklyn).

¹⁴ The Hamilton Fish Play Center bath house, designed by Carrere & Hastings in 1898, was designated a New York City Landmark in 1982. The original 1915 bath house structure at Betsy Head was destroyed by fire shortly after the 1936 opening of the pool, and was rebuilt in 1939.

³¹ City of New York, Office of the Mayor, "Press Release..." August 2, 1984.

³² All entrances to the bath house and pool deck areas are secured by non-historic wrought iron gates or doors.

³³ The original ticket booth was replaced in the early 1980s as part of a larger restoration of the pool complex. Currently, patrons purchase admission tickets from a kiosk along the right (south) wall of the courtyard.

³⁴ The footbaths consisted of depressions placed in the narrow corridor leading to the pool, which would spray an acidic compound on the user's feet.

³⁵ The existing bronze letters are apparently non-historic replicas.

³⁶ Three non-historic handrails are located along the stairway; a non-historic wrought iron gate and fencing are located beneath the archway; non-historic Parks Department signage and a display case hang on the staircase sidewalls along Fulton Avenue.

³⁷ Non-historic wrought iron fencing and a window grille secure the openings of the west facade; a non-historic circular maple-leaf Parks Department sign hangs from the west facade of the south entry pavilion.

³⁸ Above the cast stone coping, a non-historic guardrail lines the roofline of the north and south pavilions, replacing an original bronze pipe railing with bronze stanchions.

³⁹ The clocks are non-original replicas of the bronze clocks originally mounted at the Play Center.

⁴⁰ The glass block enclosures are non-original replicas from the 1980s; the original enclosures did not include metal edging or coping; the narrow opening on the north facade of the northern enclosure is not historically accurate.

⁴¹ A non-historic guardrail runs along the cast stone band, replacing an original bronze pipe railing with bronze stanchions.

⁴² The concrete supports spanning the undersides of the openings at the first story are apparently later interventions.

⁴³ All of the openings along this rear wall have been filled in with non-historic green paneling and have been retrofitted to accommodate standard doors; the archways leading to the men's and women's locker rooms originally featured rolling steel shutters; non-historic Parks Department signage is found on this wall, most notably, the large rectangular sign above the former ticket booth opening.

⁴⁴ The archway of the north elevation contains a non-historic wrought iron fence, while the archway of the south wall is filled in with green paneling that is similar to the rear (east) wall of the entrance courtyard and that is blocked by the modern ticket kiosk; a service entrance beneath a segmental gauged arch on the rear (east) wall of gallery area's first-story north corridor does not appear on the original plans for the bath house, but is most likely original, and has been filled in with non-historic double doors.

⁴⁵ The handrails of the balcony have been made building code-compliant by the addition of metal piping.

⁴⁶ The existing casement windows found throughout the landmark site were probably installed in the 1980s, and are not the Play Center's original windows. While the original windows were also casement windows, the existing windows are not replicas. The majority of the existing windows feature arched, multi-paned, fixed upper sashes and movable lower sashes, while the original windows typically featured movable central sashes. Currently, all of the windows of the landmark site are covered on the exterior by non-historic rectangular mesh screens and arched metal spandrels.

⁴⁷ The original arched window opening above the new doorway was shortened to accommodate the doors.

⁴⁸ The louvered vents of the box-like pavilions of the bath house south facade are likely arched at the top, but are currently obscured by non-historic rectangular mesh screens and arched metal spandrels.

⁴⁹ Non-historic Parks Department signage, lighting, security cameras, and a speaker system, are affixed to the south facade.

⁵⁰ A non-historic guardrail lines the rooftop to the west of the left-hand (western) pavilion.

⁵¹ The entire length of the north facade of the bath house, to a height of approximately six feet, has been painted red.

⁵² The "mother's room" has been converted into a men's bathroom, while the "director's office" is currently used as storage space for the Parks Department staff of the Bathgate Playground.

⁵³ Non-historic Parks Department signage and a display case hang from the left-hand pavilion of the north facade of the bath house.

⁵⁴ The single-story recessed area to the west of the right-hand pavilion has its original cast stone coping exposed on both the north and west facades; a metal security grille covers the exterior of the window on the north facade; a non-historic guardrail lines the roofline to the north and to the west.

⁵⁵ The former diving pool was filled in by the Parks Department in the spring of 2005.

⁵⁶ The underside of the overpass area, including portions of the bath house and first aid building, are painted in light and dark shades of blue, matching other painted areas of the pool deck.

⁵⁷ Non-historic Parks Department signage hangs from both the overpass and the first aid building.

⁵⁸ The bleachers and the stairs have been painted.

⁵⁹ The scenes depicted on the roundels, designed by Frederick G. R. Roth, are (from left to right): children building a sand castle (painted in color); woman and dog beneath a beach umbrella (painted white); man and seal along water with setting sun (painted white); a Medusa-like sea creature (painted white); winged pixie on the back of a snail, cattails (painted in color); underwater swimmers, boat and sun on horizon (painted white); Triton with staff, encircled by fish (painted white); diver, fish in sky (painted white); winged pixie on the back of a dolphin (painted color); woman in profile on water's surface (painted white); man in profile blowing a conch shell, on the back of a sea turtle (painted white); Egyptian-inspired depiction of two men on a raft with palm trees (painted white).

-
- ⁶⁰ The niches have been painted in alternating shades of light and dark blue, matching other painted areas of the pool deck; the canopy and portions of the retaining wall have been similarly painted; one pilaster has a red-painted patch.
- ⁶¹ The panels are painted in alternating shades of light and dark blue, matching other painted areas of the pool deck.
- ⁶² The remains of historic lighting fixtures still hang from the west facade of the filter house; the first pilaster from the left (north) has a red-painted patch.
- ⁶³ The full-height glass block windows were apparently originally lined on either side with glazed tiles; several of the glass blocks are broken, while others have been patched with concrete or brick.
- ⁶⁴ The concrete surfacing of the pool deck area has been ramped slightly to meet the thresholds of both the north and south entrances to the filter house, making the filter house handicap accessible.
- ⁶⁵ The semicircular window was likely filled in during the repairs to the pool complex that took place after the vandalism of 1971, during which all of the Play Center windows were filled in to avoid a repeat incident.
- ⁶⁶ The original coping of the filter house has been painted.
- ⁶⁷ Two of the original portal windows of the nine bays of the filter house have been replaced by rectangular louvered vents, while the others have been filled in with concrete.
- ⁶⁸ Storage for a freestanding concession stand was originally contained within this space; an additional service door has been filled in at the basement level.
- ⁶⁹ Non-historic handrails are also present.
- ⁷⁰ On the south side of the stairs, a wrought iron fence runs between the two piers.
- ⁷¹ With the exception of the former wading pool area, most of the retaining walls along Fulton Avenue are painted (non-historic).
- ⁷² Both ancillary stairways, to different degrees, have been painted (non-historic); access to the northern ancillary stair case is blocked by non-historic chain-link fencing along Fulton Avenue.

FINDINGS AND DESIGNATION

On the basis of careful consideration of the history, architecture, and other features of the building and site, the Landmarks Preservation Commission finds that the Crotona Play Center has a special character, special historical and aesthetic interest, and value as part of the development, heritage, and cultural characteristics of New York City.

The Commission further finds that, among its important qualities, the Crotona Play Center is one of a group of eleven immense new outdoor swimming pools which were opened in the summer of 1936 by Mayor Fiorello LaGuardia and Parks Commissioner Robert Moses; that it was the only one of the eleven pools sited in the borough of the Bronx; that it was constructed with funding provided by the Works Progress Administration; that the Play Center is considered one of the great WPA Art Moderne structures of the Depression era in New York; that the main entrance, set high above the street level, has a striking presence on Fulton Avenue; that the towered monumental arched gateway is composed of robust geometric forms; that repeated motifs, such as buttressed bays, arched clerestory windows, decorative brick railings, and whimsical cast stone details, help to create a cohesive site; that the advanced systems of the Play Center were considered the epitome of technological modernity; that areas adjacent to the pool complex, including the wading pool and pedestrian pathways, were developed also during the WPA-era; that the original and creative use made of modest materials and forms, and the careful siting of the facility, make it a distinguished, individual design; and that the complex, along with the other WPA-era pools, was a major accomplishment of engineering and architecture, and is recognized as being among the most remarkable public recreational facilities ever constructed in the United States.

Accordingly, pursuant to the provisions of Chapter 74, Section 3020 of the Charter of the City of New York and Chapter 3 of Title 25 of the Administrative Code of the City of New York, the Landmarks Preservation Commission designates as a Landmark the Crotona Play Center, including the bath house, swimming pool, diving pool, bleachers, filter house, retaining wall with seating niches, terrace site of former wading pool and approach stairs, retaining walls, fencing and linking pathways, Fulton Avenue between East 172nd Street and East 174th Street, Borough of The Bronx and designates Borough of the Bronx Tax Map Block 2941, Lot 1, in part, and portions of the adjacent public way, consisting of the property bounded by a line beginning at a point located on the eastern curblin of Fulton Avenue that is approximately 60 feet to the east of the intersection formed by the western curblin of Fulton Avenue and the southern curblin of East 172nd Street, extending southerly approximately 90 feet to a point located on the eastern curblin of Fulton Avenue which intersects with a line extending westerly from the southernmost curblin of the rectangular landing located directly south of southernmost gate of the Crotona Play Center, continuing easterly along that line and southeasterly along the southernmost curblin of the asphalt pedestrian path as it curves northerly and extends across four intersecting paths to the eastern curblin of the asphalt pedestrian path's easternmost point located approximately 320 feet east of the brick retaining wall on the eastern side of the Crotona Play Center, then continuing northerly along that curblin as it curves westerly, crossing three intersecting pedestrian paths, then continuing westerly along a line extending from the northernmost wall of the two-story masonry Crotona Play Center bath house to an intersecting

point on the easternmost curblineline of the asphalt pedestrian path located approximately 30 feet to the east of the northeast corner of the Crotona Play Center bath house, then continuing northerly along the that curblineline to a line intersecting with a line extending easterly from the northernmost point of the curved asphalt pedestrian path located directly north of the former wading pool area, then continuing westerly along that line to the eastern curblineline of Fulton Avenue and southerly along the eastern curblineline of Fulton Avenue to the point of the beginning as its Landmark Site.
